

LogFrame Checklist

1. LogFrame should follow causal logic:
 - If...then, why, and how
2. Results statements should be:
 - Clear
 - Meaningful
 - Specific
 - Measurable
 - Feasible
3. Results should *cause* the level above, not *define* it.
4. LogFrame should not state the same thing in the Sub-Purpose as is said in the Purpose.
5. Remember, the Purpose should describe the final end condition the project wants to achieve.
6. The Purpose, Sub-Purposes, and Immediate Outcomes should not be inverted.
7. Remember, the lower level causes the upper level to happen.
8. Capacity building is a means to an end; that end is what should appear in Purposes and Sub-Purposes, not capacity building (with some exceptions)
9. Results statements should be uni-dimensional: Different levels should not be crammed into one result. (Tip: Watch for the words *by, through, to, in order to, so that, via.*)
10. Indicators should measure the results statements.
11. Assumptions need to be specific and measurable (if possible), valid, relevant, and must be monitored.
12. Risks must be assessed and mitigated.
