---

These training materials are made possible by the generous support of the American people through the support of the Office of Health, Infectious Diseases, and Nutrition, Bureau for Global Health, U.S. Agency for International Development (USAID) and USAID/Malawi, under terms of Cooperative Agreement No. AID-OAA-A-12-00005, through the Food and Nutrition Technical Assistance III Project (FANTA), managed by FHI 360.

The contents are the responsibility of FHI 360 and do not necessarily reflect the views of USAID or the United States Government.
Preface

The Malawi Inpatient Management of Severe Acute Malnutrition Training Package includes training modules, training guides, training aids, training planning tools, and job aids. The training package is based on the 2002 WHO Training Course on the Management of Severe Malnutrition (SAM) and has been updated to include the 2013 WHO update on management of SAM in infants and children. The training package guides participants in applying the National Guidelines for the Community-based Management of Acute Malnutrition (CMAM), 2016.

This Guide is one of a set of training guides and modules for conducting the Training Course on Inpatient Management of Severe Acute Malnutrition:

Guides
Facilitator Guide
Clinical Instructor Guide
Course Director Guide

Modules
Module 1—Introduction
Module 2—Principles of Care
Module 3—Initial Management
Module 4—Feeding
Module 5—Daily Care
Module 6—Monitoring, Problem Solving and Reporting
Module 7—Involving Mothers in Care

The Facilitator Guide is one part of a set of training guides and modules for conducting the Training Course on Inpatient Management of Severe Acute Malnutrition. The user of this guide should be familiar with the course materials and teaching methods.
Acknowledgements

This inpatient management of children with severe acute malnutrition (SAM) training course is the practical application of the 1999 World Health Organisation (WHO) publication Management of Severe Malnutrition: A Manual for Physicians and other Senior Health Workers, and the WHO is grateful to all those involved in the production of this fundamental training course. The WHO would particularly like to thank ACT International, USA, and especially Ms P. Whitesell Shirey for having developed the manuscript of the Training Course, together with Ms F. Johnson, who also acted as the course coordinator during field testing. The WHO acknowledges with all gratitude the substantial technical contribution and advice of Professor A. Ashworth-Hill from the London School of Hygiene and Tropical Medicine, who has also acted as one of the course facilitators. Special thanks are extended to Dr S. Khanum (former Regional Adviser for Nutrition and Food Safety, WHO Regional Office for South-East Asia in New Delhi), Department of Nutrition for Health and Development, for her technical contribution, comments, and advice throughout the development of the training modules and for organising field testing as a course director.

The WHO also expresses its appreciation for helpful contributions from course facilitators during the field testing of the training modules, notably, Dr S. Aiyer, India; Dr T. Nu Shwe, Myanmar; Dr E. Poskitt, United Kingdom; Dr T. Ahmed, Dr S. Shakur, and Dr K. Jamil, Bangladesh; and all the course participants from Bangladesh, Bhutan, Indonesia, Myanmar, and Nepal.

The WHO expresses sincere gratitude to Professor J.C. Waterlow, United Kingdom, and to Professor A. Jackson, University of Southampton, United Kingdom, for their technical support and expertise during preparatory meetings held in London in November 1999 and September 2000.

Also acknowledged are contributions of the WHO staff in the Department of Nutrition for Health and Development, Dr G.A. Clugston and Dr M. de Onis, and support from the Department of Child and Adolescent Health and Development.

The WHO would like to thank the International Centre for Diarrhoeal Disease Research, Bangladesh for conducting the field testing of the training modules.

The financial support of the governments of the United Kingdom of Great Britain and Northern Ireland (Department for International Development) and the Kingdom of The Netherlands toward the development and publication of this training course is also gratefully acknowledged.

Acknowledgements for the Adaptation of the Training Course to Malawian Context

This modified version of the training materials for the course on inpatient management of SAM is the practical application of the National Guidelines for the Community-based Management of Acute Malnutrition (CMAM), 2016.

The adaptation of these training materials was done under the guidance of the Directorate of Clinical Services and Department of Nutrition HIV and AIDS (DNHA). In this regard, the MOH would like to acknowledge policy direction from Dr George Chithope Mwale, Director of Clinical Services–MOH, Mr Felix Pensulo Phiri, Director of Nutrition–DNHA, and Mrs Janet Guta, Deputy Director of Clinical Services–Nutrition.

The Ministry of Health (MOH) wishes to particularly thank Dr Beatrice Amadi (WHO Course Director) and Professor Geert Tom Heikens (International Consultant) for the review of the training materials. The MOH also thanks Mr Sylvester Kathumba (Principal Nutritionist–MOH), Dr John Phuka (National Course Director), Dr Ajib Phiri (National Clinical Instructor), Violet Orchardson (Nutrition Specialist, USAID/Malawi), Alice Nkoroi (Country Project Manager, FANTA), Dr Jaden Bendabenda (Deputy Project Manager, FANTA) and Dr Pamela Gunda (Senior Medical Officer and...
Clinical Instructor, FANTA) who skilfully guided all reviewers, facilitators, and trainees, as well as field testing the training materials.

Also acknowledged are the valuable contributions of the following for facilitating the case management trainings and participating in the review and field testing of the training materials at the regional level. Finally, thanks go to all the participants in the case management trainings for their valuable comments during field testing of the training materials.

Dr Susan Kambale  World Health Organization
Wilfred Gaven  Malawi College of Health Sciences

Introduction

What methods of instruction are used in this Case Management Training?

This Case Management Training uses a variety of instruction methods, including reading, written exercises, discussions, role-plays, video, demonstrations and practice in a real nutrition rehabilitation ward. Practice, whether in written exercises or on the ward, is considered a critical element of instruction.

How is the Case Management Training conducted?

- Small groups of participants are led and assisted by ‘facilitators’ as they work through the seven course modules (booklets that contain units of instruction). The facilitators are not lecturers, as in a traditional classroom. Their role is to answer questions, provide individual feedback on exercises, lead discussions, structure role-plays and so on.
- The modules provide the basic information to be learned. Information is also provided through demonstrations, photographs and videotapes (to strengthen knowledge).
- The modules help each participant develop the specific skills necessary for case management of children with severe acute malnutrition (SAM). Participants develop these skills as they read the modules, observe live and videotaped demonstrations and practise skills in written exercises, group discussions, oral drills and role-plays (to develop and practise skills, with appropriate attitudes).
- After practising skills in the modules, participants practise the skills in a real hospital setting, with supervision to ensure correct patient care. A clinical instructor supervises the clinical sessions in the NRU.
- To a great extent, participants work at their own pace through the modules, although in some activities, such as role-plays and discussions, small groups work together.
- Each participant discusses any problems or questions with a facilitator, and receives prompt feedback from the facilitator on completed exercises. (Feedback includes telling the participant how well he/she has done the exercise and what improvements could be made.)

For whom is this Case Management Training intended?

This Case Management Training is intended for clinicians, nurses, nutritionists, and dieticians who manage children with SAM with poor appetite and/or medical complications in inpatient care in hospitals. Clinicians, nurses, nutritionists and dieticians must work closely together as a team, so they should have consistent training in the use of the same case management practices. Because of their different job responsibilities and backgrounds, however, nurses and clinicians may find different parts of this Case Management Training more interesting and applicable to their work. Nurses, in particular, may find that some parts of this Case Management Training are more detailed than they need, or that they would like more explanation or time to understand certain concepts.

Because of their different backgrounds and interests, clinicians and nurses may be assigned to separate small groups if necessary. However, clinicians, nurses and nutritionist should work together when planning and implementing quality improvement (QI) activities in their hospitals.

Throughout the Facilitator Guide there are special sections for ‘nurses and nutritionists (as appropriate)’ printed in shaded boxes. These notes suggest how facilitators can adapt the course materials for nurses and nutritionists groups as needed. Some of the suggestions may also be used for
groups of clinicians if they are having difficulty understanding a concept or doing the work at a suitable pace.

**What is a ‘facilitator’?**

A facilitator is a person who helps the participants learn the skills presented in the Case Management Training. The facilitator spends much of his/her time in discussions with participants, either individually or in small groups. For facilitators to give enough attention to each participant, a ratio of 1 facilitator to 3–6 participants is desired. In your assignment to teach this Case Management Training, you are a facilitator.

As a facilitator, you need to be very familiar with the material being taught. It is your job to explain, demonstrate, answer questions, talk with participants about their answers to exercises, conduct role-plays, lead group discussions, assist the clinical instructor with clinical practice in hospital and generally give participants any help they need to successfully complete the Case Management Training. You are not expected to teach the content of the Case Management Training through formal lectures (nor is this a good idea, even if this is the teaching method to which you are most accustomed).

**What, then, does a facilitator do?**

As a facilitator, you do **three basic things**.

1. **You INSTRUCT:**
   
   - Make sure that each participant understands how to work through the materials and what he/she is expected to do in each module and each exercise.
   
   - Answer the participant’s questions when they are asked.
   
   - Explain any information that the participant finds confusing, and help him/her understand the main purpose of each exercise.
   
   - Lead group activities, such as group discussions, oral drills, video exercises and role-plays, to ensure that learning objectives are met.
   
   - Promptly review each participant’s work and give correct answers.
   
   - Discuss with the participant how he/she obtained his/her answers to identify any weaknesses in the participant’s skills or understanding.
   
   - Provide additional explanations or practice to improve skills and understanding.
   
   - Help the participant understand how to use skills taught in the Case Management Training in his/her own hospital.
   
   - Assist the clinical instructor as needed during clinical sessions.

2. **You MOTIVATE:**
   
   - Compliment the participant on his/her correct answers, improvements or progress.
   
   - Make sure that there are no major obstacles to learning (such as too much noise or not enough light).

3. **You MANAGE:**
   
   - Plan ahead and obtain all supplies needed each day, so that they are in the classroom or taken to the hospital ward when needed.
• Monitor the progress of each participant.

How do you do these things?

• Show enthusiasm for the topics covered in the Case Management Training and for the work that the participants are doing.

• Be attentive to each participant’s questions and needs. Encourage the participants to come to you at any time with questions or comments. Be available during scheduled times.

• Watch the participants as they work, and offer individual help if you see a participant looking troubled, staring into space, not writing answers or not turning pages. These are clues that the participant may need help.

• Promote a friendly, cooperative relationship. Respond positively to questions (by saying, for example, ‘Yes, I see what you mean’ or ‘That is a good question’). Listen to the questions and try to address the participant’s concerns, rather than rapidly giving the ‘correct’ answer.

• Always take enough time with each participant to answer his/her questions completely (that is, so that both you and the participant are satisfied).

What NOT to do.....

• During times scheduled for clinical training activities, do not work on other projects or discuss matters not related to the Case Management Training.

• In discussions with participants, avoid using facial expressions or making comments that could cause participants to feel embarrassed.

• Do not call on participants one by one as in a traditional classroom, with the potential for an awkward silence when a participant does not know the answer. Instead, ask participants to voluntarily respond, or do drills that require participants one by one to give quick answers to simple questions. If a participant cannot answer the question quickly enough or gives the wrong answer, move on to the next participant.

• Do not lecture about the information that participants are about to read.

• Do not review text paragraph by paragraph. (This is boring and suggests that participants cannot read for themselves.) As necessary, review the highlights of the text during individual feedback or group discussions.

• Avoid being too much of a showman. Enthusiasm (and keeping the participants awake) is great, but learning is most important. Keep watching to ensure that participants understand the materials. Difficult points may require you to slow down and work carefully with individuals.

• Do not be condescending. In other words, do not treat participants as if they are children. They are adults.

• Do not talk too much. Encourage the participants to talk.

• Do not interrupt or distract the clinical instructor when he/she is conducting a clinical session. He/she has certain objectives to cover in a limited time.
• Do not be shy, nervous or worried about what to say. This *Facilitator Guide* will help you remember what to say. Just use it!

**How can this Facilitator Guide help you?**

This *Facilitator Guide* will help you teach the course modules, including the video segments. For each module, this *Facilitator Guide* includes the following:

• A list of the procedures to complete the module, highlighting the type of feedback to be given after each exercise
• A list of any special supplies or preparations needed for activities in the module
• Guidelines describing:
  o How to do demonstrations, role-plays and group discussions
  o How to conduct the video exercises
  o How to conduct oral drills
  o Points to make in group discussions or individual feedback
• Notes on how to adapt the procedures for nurses (and nutritionists) groups, if needed
• A place to write down points to make in addition to those listed in the guide.

At the back of this *Facilitator Guide* is a section titled ‘Facilitator Guidelines for All Modules’. This section describes training techniques to use when working with participants during the Case Management Training. It provides suggestions on how to work with a co-facilitator. It also includes important techniques to use when:

• Participants are working individually
• You are providing individual feedback
• You are leading a group discussion
• You are coordinating a role-play

To prepare yourself for each module, you should:

• Read the module and work the exercises.
• Check your answers by referring to the answers provided in the back of each module.
• Read in this *Facilitator Guide* all the information provided about the module.
• Plan with your co-facilitator how work on the module will be done and what major points to make.
• Collect any necessary supplies for exercises in the module, and prepare for any demonstrations or role-plays.
• Think about sections that participants might find difficult and questions they may ask.
• Plan ways to help with difficult sections and answer possible questions.
• Ask participants questions that will encourage them to think about using the skills in their own hospitals.

Checklist of Other Supplies Needed

Supplies Needed for Each Person
- Name tag and holder
- 2 pens
- 2 pencils with erasers
- Paper
- Highlighter
- Calculator (on personal mobile phones)

Supplies Needed for Each Small Group
- Paper clips
- Pencil sharpener
- Stapler and staples
- Scissors
- 1 roll masking tape
- Extra pencils and erasers
- Flipchart pad and markers OR blackboard and chalk
- Laptop computer and digital projector (if possible)

In addition, certain exercises require special supplies. Supplies for demonstrations, role-plays and group activities for each small group include:

- Copies of recipes for F-75, F-100 and Infant Formula or F-100 Diluted used in the hospital, and packets of ready-to-use therapeutic food (RUTF). If these are not suitable, you may use generic recipes for F-75 and F-100 given in Annex A, Module 4. Feeding.

- All ingredients, containers, utensils and other supplies needed to prepare recipes for F-75 and F-100, infant formula or F-100 Diluted and rehydration solution for malnutrition (ReSoMal). (For example: mixing spoon, whisk/spoon, containers to hold 1–2 litres, measuring cup, medicine cup with ml marking, 50 ml syringes, small cups, spoons. Equipment such as a blender or hot plate for cooking may be needed. If necessary, some of the supplies may be shared by all of the groups in a specified kitchen area.)

- Props for role-plays: a baby doll with clothes, a basin for bathing, a towel, a cup and saucer for feeding. (Creative substitutions are allowed.)

Supplies Shared by Groups

Near the classrooms, all groups need access to the following equipment and supplies, to be shared by the groups:

- Photocopy machine
- Laptop computer and digital projector, preferably in a separate room that groups can easily go to
- (If sharing these items) hot plate, blender, dietary scale as needed for recipes
- Electrical outlets, extension cords if needed

1. **Course Registration**

Ask participants to complete the course registration form as soon as the participants arrive. The participants will indicate their name, job title, the facility where they come from, whether the facility has a Nutrition Rehabilitation Unit (NRU) and whether the participants’ work station is the NRU. Refer to Annex F: Training Course Registration Form of the Course Director’s Guide. The registration form should be printed in advance and give to each participant. An attendance sheet should also be circulated.

2. **Introductions**

Introduce yourself and have other facilitators and training organisers to introduce themselves and their roles in the training and as everyone to write their names on the blackboard or flipchart. Ask the participants to introduce themselves, stating whether they have previously attended a training course in inpatient management of SAM children or CMAM training, and the period they have been working in inpatient care for SAM children. Ask the participants write their names on the blackboard or flipchart. (If possible, also have them write their names on large name cards at their places). Leave the list of names where everyone can see it. This will help you and the participants learn each other’s names.

3. **Have participants discuss their responsibility for care of children with SAM**

Explain to participants that you would like to learn more about their responsibilities for caring for children with SAM. This will help you understand their situations and be a better facilitator for them. For now, you will ask each of them to tell where he/she works and what his/her job is. During the Case Management Training, you will further discuss what they do in their hospitals.

Begin with the first participant listed on the flipchart and ask the two questions below. Note the answers on the flipchart.

- What is the name of the hospital where you work and where is it?
- What is your position or responsibility for children with SAM?
Note: Have the participant remain seated. You should ask the questions and have the participant answer you, as in a conversation. It is very important at this point that the participant feels relaxed and not intimidated or put on the spot. (Though it may be interesting to you to ask the participant more questions about his/her responsibilities, do not do that now. This should not be a long discussion.) The test results will inform the facilitator what parts in the management of SAM are not well understood, and what needs to be strengthened during the course.

4. Take care of any necessary administrative tasks

There may be some administrative tasks or announcements that you should address. For example, you may need to explain the arrangements that have been made for lunches, transportation of participants and payment of per diem.

This is a good time to distribute the Case Management Training schedule and point out when your group will be visiting the hospital’s inpatient care (NRU) for clinical practice.

5. Conduct a pre-course test

Explain that at the beginning and at the end of the Case Management Training a test will be given to evaluate the quality of the training, the participants’ learning process as well as their individual capacity levels.

The questions will reflect clinical knowledge and skills that health care providers are expected to have when involved in CMAM. Inform participants that the test will take no longer than half an hour. Inform participants that a similar test will be conducted at the end of the Case Management Training. Introduce and conduct the pre-course test.

6. Explain your role as facilitator

Explain to participants that, as facilitator (and along with your co-facilitator, if you have one), your role throughout this Case Management Training is to:

- Guide them through the Case Management Training activities
- Answer questions as they arise or find the answer if you do not know
- Clarify information they find confusing
- Give individual feedback on exercises where indicated
- Lead group discussions, drills, video exercises and role-plays
- Observe and help as needed during their practice in clinical sessions

Explain that there will be a clinical instructor appointed who will organise and lead the clinical sessions held at the hospital.

7. Give an overview of CMAM in Malawi

Give an overview of CMAM, and then lead a group discussion on the CMAM strategy of integration and scale-up in Malawi. Let the participants know that the CMAM overview presentation is available on handouts for further reference.

8. Answer any questions about the overview of CMAM

Respond to any questions that arise after the presentation. Note that participants may ask questions that are addressed in modules. You will need to park those questions until the module is covered. Usually those questions are clarified after participants have read the module.
9. **Divide the participants into two to three groups**

The participants will be split into two to three groups if the number of participants is large. Direct the other group to a separate classroom where they will complete the rest of the modules. One class should have less than 20 participants and at least three facilitators. Once the participants are settled in their respective classes, proceed to **Module 1. Introduction**.

</tbody>
</table>

* Throughout this Facilitator Guide, further information for each of the numbered procedures in the tables is given on subsequent pages.

1. **Introduce yourself and your co-facilitator**

   Introduce yourself as a facilitator (and your co-facilitator, if any) of this Case Management Training and write your name on the blackboard or flipchart.

2. **Introduce the module**

   Explain that the short Introduction module briefly describes the problem of severe acute malnutrition and the need for improved case management. It also describes the course methods and learning objectives. Explain that this module, like all the modules that the participants will be given, is theirs to keep. As they read, they can highlight important points or write notes on the pages if they wish.

   Ask the participants to read the Introduction module now. They should continue reading to the end of the module.

3. **Answer questions**

   When everyone has finished reading, ask if there are any questions about the Introduction. Participants may have questions about the equipment and supplies listed in the Annex. They may be concerned that some items are not available in their hospitals, or they may wonder why certain items are needed. Explain that the need for each item will be explained in the modules. Explain that many hospitals would lack some of these items and need to obtain them. There will be opportunities in the course to discuss problems such as lack of supplies.

4. **Explain your role as facilitator**

   Explain to participants that, as facilitator (and along with your co-facilitator, if you have one), your role throughout this course will be to:
   - Guide them through the course activities
   - Answer questions as they arise or find the answer if you do not know
   - Clarify information they find confusing
   - Give individual feedback on exercises where indicated
   - Lead group discussions, drills, video exercises and role-plays
• Observe and help as needed during their practice in clinical sessions.

Explain that there will be a separate clinical instructor who will organize and lead the clinical practice sessions held at the hospital.

5. **Continue to the next module**

Proceed directly to the **Module 2. Principles of Care**
## Facilitator Guidelines for Module 2: Principles of Care

### Preparing for the module

Prepare carefully by reviewing the exercises and discussing with your co-facilitator how to work together to lead the group discussions, role-plays and so on. This section of the *Facilitator Guidelines* describes special supplies or preparation needed for this module.

At the end of this module, you will show a video showing signs of SAM and transformations that can occur with correct case management of children with SAM. Depending on arrangements made by your Course Director, you may need to take the participants to another room to view the video. Find out what arrangements have been made. Make sure the following equipment and supplies are available. Learn how to operate the equipment and practise using it.

- Video
- Laptop computer
Digital projector
Electrical outlets, cables
Anthropometric measurements: MUAC tapes, weighing scales for children and infants and height boards
Healthy children

1. **Introduce Module 2**

Explain that Module 2 describes how to recognise a child with SAM and how to measure the child’s MUAC, weight and height/length and how to classify SAM. The module gives an overview of correct case management for children with SAM and provides a rationale for the main components of case management. The module also describes how the child with SAM is different, and why this affects care. Participants will use their Photographs booklets in this module to see signs of SAM. Later, in the clinical session, they will look for these signs in children in hospital.

Ask participants to read pages 1–9 of Module 2 and complete Exercise A on pages 10–12 using the Photographs booklet. Encourage participants to ask you questions while they are reading or completing the exercise.

**Nurses and nutritionists (as appropriate):** Discuss several photos in Exercise A as a group before asking the participants to work individually on the exercise. This exercise can be very time-consuming. If you expect that the group will work slowly, you may assign two or three photos to each person rather than having everyone review all of the photos. Then the assigned person can present those photos in the group discussion at the end of the exercise.

2. **Exercise A: Individual work followed by group discussion – Identifying signs of severe acute malnutrition (SAM) in photographs**

Possible answers for this exercise are provided in the back of the Module 2. The answers are also repeated in this guide for your convenience. Refer to the answers as you lead this discussion. Remember that the answers given are possible answers. There is room for discussion of almost all of the photos.

In many cases, the degree of a problem cannot accurately be judged without examining the child.

First point out the signs in **Photo 1** (answered as an example in the exercise).

Next, for each photo in turn, ask a different participant what signs are visible. Ask the more confident participants first. If a participant does not mention all of the signs, ask ‘Does anyone see another sign?’

Avoid discussing irrelevant signs at length. Remind them to look for: severe wasting, oedema, dermatosis and eye signs.
Possible Answers to Exercise A:

Photo 1: Moderate oedema (++) seen in feet and lower legs. Severe wasting of upper arms. Ribs and collar bones clearly show.

Photo 2: Severe dermatosis (+++). Note fissure on lower thigh. Moderate oedema (++) at least. Feet, legs, hands and lower arms appear swollen. The child’s face is not fully shown in the photo, but the eyes may also be puffy, in which case the oedema would be severe (+++). The child looks unwell; probably the child is unconscious.

Photos 3 and 4: These show the front and back of the same child. The child has severe wasting. From the front, the ribs show and there is loose skin on the arms and thighs. The bones of the face clearly show. From the back, the ribs and spine show; folds of skin on the buttocks and thighs look like ‘baggy pants’. There seems to be dermatosis on the head.

Photo 5: Generalised oedema (+++). Feet, legs, hands, arms and face appear swollen. Probably moderate (+) dermatosis. Several patches are visible, but you would have to undress the child to see if there are more patches or any fissures. There may be a fissure on the child’s ankle, but it is difficult to tell. The child appears to be very sick.

Photo 6: Severe wasting. The child looks like ‘skin and bones’. Ribs clearly show. The child’s upper arms are extremely thin with loose skin. (Also note the sunken eyes, a possible sign of dehydration, which will be discussed later.) There is some discoloration on the abdomen, which may be mild dermatosis (+); it is difficult to tell from the photo. The child is very ill.

Photo 7: Mild dermatosis (+). This child has skin discoloration, often an early skin change in malnutrition. There is some wasting of the upper arms, and the shoulder blades show.

Photo 8: Pus, a sign of eye infection.

Photo 9: Corneal clouding, a sign of vitamin A deficiency.

Photo 10: Bitot’s spot, a sign of vitamin A deficiency. Inflammation (redness), a sign of infection.
Photo 11: Corneal clouding, a sign of vitamin A deficiency. The irregularity in the surface suggests that this eye almost certainly has an ulcer.

Photo 12: Corneal ulcer (indicated by arrow), emergency sign of vitamin A deficiency. If not treated immediately with vitamin A and atropine, the lens of the eye may push out and cause blindness. This photo also shows inflammation, a sign of infection.

Photo 13: Since only the legs are visible, we cannot tell the extent of oedema. Both feet and legs are swollen, so it is at least moderate (++). Notice the ‘pitting’ oedema in lower legs.

Photo 14: Moderate (++) dermatosis. Note patches on hands and thighs. You would have to undress the child to see how extensive the dermatosis is. Generalised oedema (+++). Legs, hands, arms and face appear swollen. The child looks very unwell.

Photo 15: Severe (+++) dermatosis and wasting (upper arms). Moderate (++) oedema (both feet, lower legs, possibly hands).

Point out the following additional photos and discuss them in relation to eye signs.

Photo 16 shows a photophobic child; his eyes cannot tolerate light due to vitamin A deficiency. Point out that the child’s eyes must be opened gently for examination. He is likely to have corneal clouding as in Photo 9.

For contrast, Photo 17 shows a baby with healthy, clear eyes.

At the end of the discussion, ask participants to review the answers to the exercise in the back of the module. The answers will explain how to carefully weigh and measure a child. Participants will then learn how to use the information on MUAC, weight and height and presence of oedema to determine whether a child has SAM and medical complications. Hold up the weight-for-height (WFH) and weight-for-length (WFL) look-up tables and the admission and discharge criteria job aid, and explain that participants will need to refer to this. Explain when to use MUAC, when to use WFL and when to use WFH.

3. Reading, demonstration and/or video

Ask participants to read pages 13–18 of Module 2.

Demonstrate how to measure MUAC, weight (using different scales), height and length on health children (if possible). Highlight the importance of following the steps as indicated to have accurate and precise measurements that are standardised across different measurers. If the child is measured by different measurers or repeated by the same measurer at a different time, the measurement should be the same. Underline the importance of accuracy of the measurement up to the decimals and appropriate rounding. Example: MUAC is measured in mm, length and height in cm, with one decimal and rounded, and weight in kg with 2 decimals rounded to 1 decimal.

---

1 For simplicity weight-for height (WFH) will also refer to weight-for length (WFL), for use according to the child’s age (or stature).
For rounding decimals apply the following rule: x.0 - x.4 = x.0 and x.5 - x.9 = x+1.0 for height and length; x.x0 - x.x4 = x.0 and x.x5 - x.x9 = x.x+1 for weight. Show the Video on ‘Anthropometric Measurements’.

4. Exercise B: Individual work followed by individual feedback – Determining z-scores

Ask participants to read pages 19–20.

Some groups will easily understand the reading and how to use the WFH look-up table. These groups should complete the reading through page 19 and go on to Exercise B independently. Some groups may need a demonstration of how to use the WFH look-up table available in Annex B.

Demonstration for groups (when appropriate): Before Exercise B, review the content of section 4.3 of Module 2 on pages 19–20 together and demonstrate how to use the WFH look-up table. Hold up the look-up table and point to the appropriate columns as you speak. Talk through the examples on page 20 of Module 2. Be sure that participants understand that the left side of the card is for boys and the right is for girls. Show how the lowest weights are in the outside columns on both the boys’ and girls’ sides, furthest away from the median. Explain when to use WFL and when to use WFH.

Talk through several more examples, such as the following. Ask a participant to tell you the z-score classification:

- Girl, < 2 years, 73.0 cm, 7.4 kg = –2 z-score
- Boy, > 2 years, 94.0 cm, 11.0 kg = –3 z-score
- Girl, < 2 years, 67.2 cm, 5.8 kg = –3 z-score
- *Boy, > 2 years, 75.0 cm, 7.6 kg < –2 z-score
- *Girl, > 2 years, 81.0 cm, 7.9 kg < –3 z-score

Participants may be confused by negative numbers, so use an example of a boy who is under 2 years and 70 cm in length. Ask participants to look along the row of weights and check the top of the column each time, so they see that 8.6 kg is median, 7.9 kg is –1 z-score, 7.3 kg is –2 z-score, 6.8 kg is –3 z-score and so on. Verify whether they used the WFH table of length instead of the height. Use this example to show that a child who is –3 z-score has a lower WFH than a child who is –2 z-score. Suggest that, if participants ever forget about the negative numbers, they can always look at the weights and work out the system for themselves. Ask what the nutrition status of the child will be if the child’s weight is as indicated in the column of +2 or +3 z-score.

*When a weight falls between the weights listed on the card, it may help to first point on the card to the space between the columns where the child’s weight falls. Then look at the top of those columns to see which z-scores the weight lies between. Then look back at the weights to see where the sign should go. In the example of the boy who is 73 cm, suppose that his weight is 7.6 kg, which is between 7.3 kg (–3 z-score) and 7.9 kg (–2 z-score). The weight 7.6 kg is obviously not < 7.2 kg, but < 7.7 kg, so the score is written < –2 z-score.

Since this is the first time that you will give individual feedback to the participants, be sure to make each participant feel comfortable. Some techniques to use while giving individual feedback are described in the ‘When providing individual feedback’ subsection under ‘Facilitator Guidelines for All Modules’ at the end of this guide.
Participants may not be familiar with z-scores. If a participant is interested in the concept of z-scores, encourage him/her to read Annex A of Module 2. If a participant is uncomfortable with statistics, reassure him/her that a complete understanding of z-scores is not necessary. The important thing is to know how to use the WFH look-up table to determine how the child’s weight compares to other children’s weight of the same length or height. Children whose z-score is less than –3 (< –3 z-score) are considered to have SAM.

Compare the participant’s answers to those given in the answers for this exercise at the end of the module. Discuss any differences and correct any misunderstandings. If necessary, make up another example and have the participant try it. For example, ask ‘If a girl is ___ cm long and weighs ___ kg, what is her z-score?’

Point out the instructions at the top of each page of the WFH look-up table. These instructions state that if a child is under 2 years old, or less than 87 cm tall and his/her age is unknown, measure length while the child is lying down. The instructions also state that if a child is 2 years old or older, or at least 87 cm tall and his/her age is unknown, measure height while standing up. If a child 2 years old or older, or 87 cm tall or taller, cannot stand up and so on, if the child is too weak to stand, measure length while the child is lying down and subtract 0.7 cm from the length to arrive at a comparable height.

Ask the participant to look at the answers of Exercise B.

5. Oral drill: WFH classification using the look-up tables

Tell participants that a drill is a fun, lively group exercise. It is not a test, but rather an active way to practise using information.

Ask participants to sit around the table. Each participant will need his or her WFH look-up table. Tell participants that you will call on them one by one to participate. You will usually call on them in order, going around the table. If a participant cannot answer, just go quickly to the next person and ask the question again. Participants should wait to be called on and should answer as quickly as they can.

Begin the drill. Call out the information in the first column on the left, and ask the first participant to determine the child’s z-score by using the look-up table.

If a participant cannot answer or makes a mistake, let the next person try. Keep the pace rapid. You may make up additional cases if needed.

<tr>
<td>Boy, 5 months, 52.3 cm, 3.3 kg</td>
<td>= –2</td>
</tr>
</tbody>
</table>
Ask participants to read pages 22–25 of Module 2 and complete Exercise C on page 26.

6. Exercise C: Individual work followed by group discussion – Determining whether a child should be admitted

Participants look at photos and use the following criteria to decide whether a child should be classified as having SAM. They should decide to classify a child as SAM if they have:

- Oedema of both feet (+ oedema or worse ++ or +++), and/or
- MUAC less than 115 mm, or
- WFH < −3 z-score

Further explain that children 6–59 months with SAM and medical complications should be treated in inpatient care. As soon as the children are stabilised and their medical complications are resolved, oedema decreasing, appetite regained, consistent weight gain and clinically well and alert, they are referred to outpatient care to continue treatment. Children 6–59 months with SAM without medical complications or who are clinically well and alert should be treated in outpatient care. When outpatient care is not available, all children with SAM are treated in inpatient care.

Infants less than 6 months with SAM with any medical complication, bilateral pitting oedema and growth faltering (or other concern related to feeding or the mother) should be treated in inpatient care. As soon infants with SAM are stabilised and their medical complications are resolved, oedema resolved, appetite regained, consistent weight gain and clinically well and alert, they are referred to outpatient care to continue treatment. Infants with SAM without medical complications or oedema with good weight gain and who are clinically well and alert should be treated in outpatient care from the start. When outpatient care is not available, all infants with SAM are treated in inpatient care.

For each photo in turn, ask a different participant what the child’s z-score or MUAC is, whether or not there is oedema of both feet and what decisions should be made regarding how the child should be classified as having SAM, and whether he or she should be admitted to outpatient care or inpatient care. Add to the discussion as needed based on the comments below. (These comments are in the answer sheet in the back of the module.)

**Photo 18:**
This child should be classified as having SAM. Her MUAC is > 115 mm and her WFL is > −3 z-score, but she has oedema of both feet, as well as the lower legs (at least moderate [++] oedema). If the child has appetite and no medical complications, she is admitted to outpatient care. If the child has no appetite or a medical complication, then she is admitted to inpatient care.

**Photo 19:**
This child should be classified as having SAM. Her WFL is < −3 z-score and MUAC is < 115 mm. The child has no apparent oedema. After testing the appetite and checking for signs of medical complications, it will be decided whether the child will be admitted to inpatient care or outpatient care.

---

2 Integrated Management of Childhood Illness (IMCI) danger signs: not able to drink or breastfeed or poor appetite, vomits everything, lethargy or unconsciousness, convulsions. IMCI main symptoms for referral to hospital: cough with fast breathing with lower chest wall indrawing or stridor in a calm child, diarrhoea and recent sunken eyes, high fever or stiff neck, measles now or in the past 6 months, and/or eye signs of vitamin A deficiency and/or deep extensive mouth ulcers, ear pain with tender swelling behind the ear, severe palmar pallor). See also Management of SAM flowchart job aid.
**Photo 20:** This child should be classified as having SAM. He has a MUAC < 115 mm and WFH < –3 z-score. The child has no apparent oedema. Point out that if the child has a good appetite and no medical complications, he should be treated in outpatient care. If there is poor appetite or a medical complication, he should be treated in inpatient care.

It would be important to remove his shirt to examine him. Notice that the mother in this photo is also extremely thin.

After discussing the photos in relation to classifying SAM and admissions criteria recommended for inpatient care and outpatient care, discuss the admissions criteria currently used in the participants’ own health facilities for children with SAM. For example, ask:

- What admissions criteria are used for children with SAM in Inpatient Care in your hospitals? What are the reasons for these criteria?
- Would the children in Photos 18, 19 and 20 be admitted for treatment of SAM to your health facility? If so, would they be admitted for treatment of SAM in outpatient care or inpatient care?
- If your facility is not currently using the recommended admissions criteria, could these criteria be adopted?

At the end of the discussion, inform the participants to find the answers for this exercise in the back of the module on page 44. Then do the following oral drill.

### 7. Oral drill: SAM classification

Ask participants to sit around the table. Begin the drill. Call out the information in the first, second and third column on the left (you can also read or MUAC or WFH, and not both, since they are independent indicators for wasting), and ask the first participant if the child is classified as being severely wasted. Then give the additional information in the third column, and ask whether the child should be classified as having SAM.

If a participant cannot answer or makes a mistake, let the next person try. Keep the pace rapid. You may make up additional cases if needed.

8. Reading and short answer exercise (group-checked)

Pages 27–29 of Module 2 provide the rationale for some of the case management procedures taught in the rest of the Case Management Training. Ask the group to read these pages and do the short answer exercise on page 30 as a review. The group will discuss the answers together. Use the questions as a review. Keep the discussion simple and brief. The point is to break up the reading and check participants’ understanding. Brief answers are given below.

Some participants may wish to discuss or question some of the principles of treatment described in the module. You are not expected to know the answer to every question asked. If there are questions that you cannot answer, please refer them to the Course Director.

Possible answers to exercise on page 30

1. When a child has SAM, why is it important to begin feeding slowly and cautiously?
   
   The systems of the body slow down with SAM (reductive adaptation). Rapid changes (such as rapid feeding or fluids) would overwhelm the systems, so feeding must be started slowly and cautiously.

2. Why should all children with SAM be given antibiotics?
   
   Nearly all children with SAM have bacterial infections, even if the usual signs of infection (such as inflammation or fever) are not apparent.

3. Why is it dangerous to give iron early in treatment?
   
   Because the child with SAM makes less haemoglobin (Hb) than usual, he/she already has extra iron stored in the body. If iron is given at this point, it may lead to free iron in the body, which can cause problems.

4. Why is ReSoMal preferable to regular or low-osmolarity ORS for children with SAM who have severe and/or persistent diarrhoea and/or dehydration?
   
   In SAM, the ‘pump’ that controls the balance of potassium and sodium in the cells runs slower. As a result, children with SAM have excess sodium in their cells and have lost potassium. ReSoMal has more potassium and less sodium than regular ORS and is thus better for children with SAM.

9. Reading and short answer exercise (group-checked)

Ask participants to continue reading pages 31–35 of Module 2 and do the short answer exercise on page 36. The group will discuss the answers together.

At the end of the reading, use the questions on page 36 as a review. Keep the discussion simple and brief. The point is to break up the reading and check participants’ understanding. Brief answers are given below. Details of how to prepare the feeds are covered in Module 4. Feeding.

Possible answers to short answer exercise on page 36

1. What are two important differences between F-75 and F-100 (and RUTF)?
   
   F-75 contains fewer calories than F-100 (and RUTF): 75 kcal per 100 ml as opposed to 100 kcal per 100 ml.

   F-75 contains less protein than F-100 (and RUTF): 0.9 g per 100 ml as opposed to 2.9 g per 100 ml.
2. Why is it important to have different formulas (F-75, F-100 and RUTF) for managing SAM?

Children with SAM cannot tolerate usual amounts of protein and sodium, or high amounts of fat. F-75 is needed as a ‘starter’ formula so that the body will not be overwhelmed in the initial stage of treatment. When the child is stabilised, he/she can tolerate more protein and fat. F-100 and RUTF are then used to ‘catch up’ and rebuild wasted tissues.

3. Combined mineral and vitamin mix (CM)V is included in F-75, F-100 and RUTF to correct electrolyte imbalance. What are two important minerals in this mix and why?

Potassium and magnesium. These are needed to correct electrolyte imbalance in the cells. More potassium is needed in the cells, and magnesium is essential for potassium to enter the cells and be retained.

4. What is the difference between F-100 and RUTF?

RUTF is an energy- and nutrient-dense ready-to-use food that has the same specifications as F-100, with iron added to it.

5. Why F-100 Diluted should be given to the child less than 6 months of age?

Because the formula is better adapted to the immature organs of the infant, with lower osmolarity and renal solute load, and adapted protein–fat balance.

10. Reading and short answer exercise (self-checked)

Ask participants to read pages 37–39 of Module 2 and refer to the job aids and the CMAM Guidelines when instructed to do so. Point out the short answer exercise on page 40 of Module 2. Explain that participants should complete this exercise on their own and check their own answers in the back of the module on page 44. They should then finish Module 2 by reading the last section about referral and discharge procedures (pages 41–43).

11. Video and photos: Transformations

In a short Case Management Training, participants may not be able to observe in the hospital ward the dramatic changes that can occur over time in children with SAM who are correctly managed. Thus, photos and a video are provided to show these changes.

Before or after the video, discuss Photos 21–29 with participants. These photos show changes in three children over a period of weeks. Information about each photo is provided in the Photographs booklet. (Note: Weight-for-age is given for Photos 24 and 25 since height information was not available. Nevertheless, the changes are obvious. The MUAC of the children was not taken.)

Show the Video titled Transformations. This part of the video provides a review of the signs of SAM as well as two ‘success stories’: children named Babu and Kenroy. After the video, ask participants what signs of recovery they noticed in the children. They may mention such signs as smiling, standing up or moving around and having more flesh.

Participants may wish to view this brief video segment again. That is fine as long as other groups are not waiting to use the video player.

12. Summary of the module

1. Remind participants that the purpose of this module was to give an overview of case management for children with SAM and explain some of the reasons for these case management practices. Participants will learn more about each practice in later modules. Participants will practise
actually weighing children and measuring MUAC, height or length and determining z-scores in clinical sessions.

2. Remind the participants of the classifications of SAM and the recommended criteria for triage for treating children with SAM in inpatient care or outpatient care.

3. Briefly review the process of successful management of a child with SAM with medical complications described in section 7.0 (page 31–38) of Module 2, and underline the important things NOT to do (page 38).

4. Stress the importance of emergency room personnel knowing correct case management procedures for children with SAM. Also, new health facility or hospital staff must be informed and trained.

5. Review any points that you have noted below, and answer any questions that participants may still have. (If you cannot answer a question, offer to obtain more information and discuss it later.)

**Preparing for the module**

If an overhead projector is available, you will use it to introduce the Treatment Card Initial Management Chart and demonstrate how to use it. Practise using the overhead projector and the transparencies of the Treatment Card pages provided. Alternatively, make sure that you have an enlarged copy of the Initial Management Chart that the group can look at together.

In Exercise B, the group will prepare ReSoMal. You will need the following ingredients and supplies, as well as soap and water for handwashing and clean towels (or paper towels) for drying hands:

- **ReSoMal packet** (or ORS packet with sugar and CMV), cooled boiled water (at least 1 litre for a 1-litre packet), mixing spoon, container to hold 1 or 2 litres, measuring cup or medicine cup with ml markings, or 50 ml syringe, small cups or spoons for tasting.

The Course Director should tell you where to obtain supplies. Have them ready before Exercise B. Emphasise to participants the need to use separate buckets/jugs with different colours for ReSoMal and ORS to avoid confusion.

The second segment of the **Video Emergency Treatment** will be shown during this module.
For Exercises C and E, you will need extra copies of the Initial Management Chart of the Treatment Card. Make sure that you have at least three copies per participant (preferably more, in case mistakes are made).

1. **Introduce Module 3**

Explain that this module describes measures that should be taken immediately to prevent death while stabilising a child with SAM. Some of the procedures described in this module may take place in the emergency room, before the child is admitted to the NRU. The child with SAM with medical complications is referred to and treated in the NRU as is recommended in the SAM Guidelines. If the child with SAM has no medical complications, the child is not admitted to inpatient care, but is instead transferred to and treated in the outpatient care.

If it is decided to start treatment of SAM with medical complications in the emergency room, then personnel must be taught to recognise children with SAM and treat them correctly. They must understand why children with SAM must be treated differently than other children.

Point out the learning objectives of this module on page 2. Explain that participants will first read about hypoglycaemia (low blood glucose) and hypothermia (low body temperature). These two conditions are life threatening and often occur together in severely malnourished children.

Ask participants to read through pages 6–7 of Module 3. When everyone has reached that point, you will look together at the Treatment Card, a recording form that will be used as an aid in this Case Management Training.
Nurses and nutritionists (as appropriate): Ask the group to pause when they get to the box on page 5 of the module. Ask questions to check their understanding, such as:

- What is hypoglycaemia?
- How do you know if a child has hypoglycaemia?
- How can hypoglycaemia be prevented?

All of these questions are answered in section 1.0 (pages 3–5) of the module.

Hold up the F-75 look-up table. Be sure that everyone is looking at the front of the card (not the side for children with severe [+++] oedema). Point to the columns to show how to read the card. For now, focus only on how to use the 2-hourly feed column. The other columns will be used later. Do a few examples with the group. For example, ask, ‘How much F-75 would you give a child who weighs 8.2 kg every 2 hours?’ (Answer: 90 ml.)

Explain that the reverse side of the form is only for children with severe (+++) oedema. The amounts for these children are less because their weights are falsely high. The amounts are appropriate for their estimated true weights.

Talk through section 1.4 of the module, which explains how to treat hypoglycaemia. Briefly cover the main points:

- The hypoglycaemic child needs glucose quickly.
- How to give glucose:
  - If the child can drink, give a 50 ml bolus of sugar water or 10% glucose orally.
  - If alert but not drinking, give the 50 ml bolus by nasogastric (NG) tube.
  - If lethargic, unconscious or convulsing, give 5 ml/kg body weight sterile 10% glucose intravenously, followed by 50 ml 10% glucose by NG tube.
- Start feeding F-75 half an hour after giving glucose. Give it every half hour for 2 hours. Give one-quarter of the 2-hourly amount shown on the F-75 job aid.
- When the child’s blood glucose is 3 mmol/L or higher, change to 2-hourly feeds of F-75.

Go through the example about Ali on page 5 orally, showing how to use the F-75 job aid, dividing the amount shown for a 2-hourly feed by 4.

Ask participants to read section 2.0 pages 6–9 of the module.

2. Demonstration: Use of the Initial Management Chart

Tell participants that the Treatment Card will be used in this Case Management Training as an aid to remember steps in treatment and monitoring, and also as a record of care. Participants may use a different recording form in their own hospitals such as the Patient’s Card. The Treatment Card is an example of a very complete form. Participants may eventually wish to incorporate parts of this form in their own record-keeping systems; however, this is not required.

If you are using a digital projector, use it to show the pages of the Treatment Card. Otherwise, have the group gather closely around the table where they can see enlarged copies of the Treatment Card pages or make sure they have their own hard copies. In this demonstration, you will focus on the Initial Management Chart. Other charts will be explained later.
Show the Initial Management Chart and describe it as follows. Point to the relevant sections of the page as you talk. (Do not go into too much detail, especially about sections that have not been covered in the module. This is just an introduction.) It may be helpful for one facilitator to talk while the other facilitator points to the relevant sections and writes on the form.

**Initial Management Chart**

This module focuses on this first page of the Treatment Card. It has space to record the signs of SAM and the child’s temperature and blood glucose level (point to each section). Later in this module, participants will learn about recording Hb, eye signs, signs of shock and diarrhoea. Notice there is also space to record the initial feeding and the antibiotics prescription.

For some children, this page will be used only briefly. However, if the child is in shock or needs rehydration, this page may be used for a number of hours as the child is given intravenous (IV) fluids or ReSoMal.

Tell the story of a child named Dziko as you (or your co-facilitator) record the following information on the Treatment Card in front of participants:

*Dziko is a 20-month-old boy. He was admitted on 16 August 2016 at 9:00. His hospital number is 502.*

*Dziko appears severely wasted. He has oedema of both feet and lower legs (++). He has mild dermatosis (+).*

*Dziko’s MUAC is 109 mm.*

*He weighs 7.0 kg and is 70 cm long. Ask a participant to look up Dziko’s z-score. (Answer: It is WFH < −2 z-score.) Record it. Ask if Dziko should be admitted to inpatient care. (Answer: Dziko should be admitted because he has oedema with severe wasting [MUAC is < 115 mm], the reason for inpatient care).*

*Dziko’s temperature is 36° C. Ask a participant if Dziko is hypothermic. (Answer: No, but he should be kept warm.)*

*Dziko’s blood glucose level is < 3 mmol/L, but he is alert. Ask a participant if Dziko has hypoglycaemia. (Answer: Yes.) Ask another participant what should be done. (Answer: Give Dziko 50 ml bolus of 10% glucose orally.)*

*Dziko’s Hb is 9 g/dL. His blood type is B+. He has no eye problems and has not had measles. He does not have signs of shock. He does not have diarrhoea. There is no blood in the stool and no vomiting.*

*Dziko is first fed 75 ml of F-75 at 9:30.*

Point out the spaces for recording monitoring information while a child receives IV fluids or ReSoMal, but do not try to explain these sections now. Participants will learn about them in the next sections of the module.

Dziko needs antibiotics, but do not record those now. Participants will learn about antibiotics later in the module.

**Daily Care Chart**

Show the Daily Care Chart. Module 4. Feeding, and Module 5. Daily Care, focus on this page of the Treatment Card. This page is used every day once the child has been admitted to the ward. Notice there is room for 21 days on the form.
Monitoring Chart

Show the Monitoring Chart. This page is used to record results of monitoring respiratory rate, pulse rate and temperature. This record will be explained in Module 5. Daily Care.

Weight Chart

This graph is used daily to plot the child’s weight so that increases and decreases can be easily seen. It will be explained in detail in Module 5. Daily Care. Point out that it can be used for 28 days. Do not try to explain the weight chart in detail now. Also the discharge weight (end of treatment of SAM) will be indicated on the weight chart.

Outcome Chart

This page is used as needed to record comments on any special instructions or training given to mothers. It is also where immunisations and vaccinations are recorded. When a child is transferred to outpatient care to continue treatment until full recovery, departs early (defaults), dies or does not recover in a given time period (2 months in treatment but non-response despite further medical investigations), that outcome is described on this page. The patient outcome section can be very useful in identifying and solving problems on the ward.

Return to the Initial Management Chart and re-focus the group on this page. This is the only page of the Treatment Card that participants will use in this module. They should not be concerned about the other pages at this point.

Ask participants to continue reading Module 3, section 3.0 and 4.0 on pages 10–12, and then complete Exercise A, in which they will use parts of the Initial Management Chart.

Nurses and nutritionists (as appropriate): If the group includes slow readers, you may talk through sections 3.0 and 4.0 instead of asking them to read these sections. Explain the main points in the module. Point to the relevant sections of the Initial Management Chart as you talk. The ‘SIGNS OF SHOCK’ box of the Initial Management Chart is a reminder of the signs of shock and the actions to take. The ‘HAEMOGLOBIN’ section tells when a transfusion is needed.

If the reading skills of the group are good, ask them to read Section 3.0 and then stop. Ask the group questions to check their understanding with such questions as:

• What signs of shock must be present for a child with SAM to receive IV fluids?
• What amount of IV fluids should be given?
• How often should the respiratory and pulse rate be monitored? Why?

Likewise, ask the group to read section 4.0 and then stop. Ask such questions as:

• How can you tell whether a child has severe anaemia?
• What should be done for a child with severe anaemia?

3 The term ‘mother’ is used throughout the modules and guides. It is understood that the person who is responsible for the care of the child might not always be that child’s mother, but rather some other caregiver. For the sake of readability, however, ‘mother’ means ‘mother/caregiver’ throughout the modules and guides, ‘she’ means ‘she or he’ and ‘her’ means ‘her or his’.
3. Exercise A: Individual work followed by individual feedback – Identifying initial treatments needed and recording on the Treatment Card

Participants should ask you for individual feedback after doing the first case, Chisomo. Giving feedback at this point will allow you to ensure that participants are on the right track and to correct any misunderstandings. Before participants continue with the next two cases, be sure that they know where to look on the Initial Management Chart for calculations of amounts of IV glucose and IV fluids needed.

**Nurses and nutritionists (as appropriate):** Those who quickly finish the first case (Chisomo) and receive feedback may continue to work independently on the rest of the exercise. When everyone has received individual feedback on Chisomo, continue the rest of the exercise (Tamanda and John) as a group.

Read the case description aloud and point out the signs on the Treatment Card excerpts given in the module. Ask the questions aloud and discuss each answer.

When discussing John, it will be helpful to show an overhead of the Initial Management Chart, record on it and point to the relevant sections as you talk.

Be sure to discuss special notes about Tamanda and John given on the next page.

When giving individual feedback on Tamanda and John, discuss each case with the participant and compare his/her answers to the answers provided in the back of the module. If the participant has made errors, do not simply correct them, but try to find the reason for the misunderstanding and clarify.

**Special note regarding Tamanda.** Be sure that participants understand that diuretics should never be used to reduce oedema. Tamanda receives a diuretic because she is getting a blood transfusion, and it is needed to make room for the blood.

**Special note regarding John.** Because John has hypoglycaemia and signs of shock and is lethargic, he needs 10 percent glucose by IV. He does not then need the 50 ml bolus NG tube since he will be on IV fluids, which will continue to provide glucose. If John did not have signs of shock, and would thus not receive IV fluids, he would need the 50 ml bolus NG tube.

At the end of feedback, inform participants that they will find the answer sheet in the back of the module. Rounding (or lack of rounding) may cause some discrepancies between participants’ answers and those on the answer sheet. Do not be overly concerned about these discrepancies. Explain to participants that they may need to round answers to have an amount that can be practically measured. For example, they will need to round amounts of ReSoMal at least to the nearest ml.

4. Reading and short answer exercise

Ask participants to read pages 18–23 and complete the short answer exercise on page 23. Point out that section 5.0 of the module relates to the ‘EYE SIGNS’ box of the Initial Management Chart. Section 6.0 of the module relates to the ‘SIGNS OF DEHYDRATION’ box of the Initial Management Chart.

While participants are working, make sure that you have all of the supplies needed for making ReSoMal in the next exercise. Arrange the supplies where everyone will be able to see and participate.

During this section of reading, participants should refer to the Photographs booklet, Photo 12 (corneal ulceration); Photos 6, 30 and 31 (sunken eyes); and Photo 32 (skin pinch).
5. **Exercise B: Group and individual work – Preparing and measuring ReSoMal**

Ask all participants to wash their hands. Prepare the ReSoMal using cooled boiled water so that it can actually be used in the ward.

Prepare ReSoMal according to package directions, or according to instructions on page 22 of the module. Let a different participant do each step. For example, ask one person to add the packet, another to measure the sugar, another to measure the water and so on. When weighing the sugar, be sure to weigh and subtract the weight of any container used on the scale; alternatively, weigh the sugar in a plastic bag that weighs almost nothing. When the ReSoMal has been prepared, allow each participant to taste it.

Next ask each participant to answer the questions on page 23 individually. When they have finished, inform participants to look at the answer sheet on page 54 of the module and review the answers as a group. After checking each answer, ask a different participant to measure the amount of ReSoMal in that answer. Use a small medicine cup or a 50 ml syringe to measure. Point out that these are very small amounts that will not overwhelm the child’s system. They should not be tempted to give more or give it too quickly.

Ask participants to read pages 25–26 and begin Exercise C on pages 27–32. In Exercise C, participants will need extra copies of blank Initial Management Charts. Show participants where these copies are kept in the classroom. Read out to participants the rest of the information for Yamikani and ask them to fill this in on his Treatment Card.

| Nurses and nutritionists (as appropriate): Before Exercise C, conduct this demonstration/role-play to help participants understand how **recording** on the Initial Management Chart is related to **actions** taken in the ward. |
| Show a blank Initial Management Chart on the overhead projector. One facilitator will record on this form. The other will act as a ‘mother’ holding a ‘baby’ (a rolled-up towel). Each participant in turn will ask the ‘mother’ a question, pretend to examine the baby in some way, or pretend to take blood and say what lab test should be done. The ‘mother’ will have information about the child, such as the child’s name and age, so that she can respond appropriately. The facilitator will record the mother’s answers and will also provide information in response to the participant’s actions. For example, if the participant pretends to weigh the child, the facilitator will call out the weight and record it. At the end, the group will check to see whether anything has been omitted from the Treatment Card. |
| It is not necessary for participants to ask questions or do the examination in a certain order. For example, a participant may look for signs of shock before another participant looks for oedema, or vice versa. Important concepts: |
| • All sections of the Initial Management Chart relate to important parts of the child’s history or examination. |
| • The information obtained determines the need for life-saving treatments. |
| **Information for ‘mother’ (one facilitator):** |
| • The child’s name is Babu, a boy. He is 12 months old and breastfed, although he takes some juice from a bottle. |
| • The mother brought him because of his skin problem (flaking and raw skin in several places). |
| • He has not had measles. |
| • There has been no diarrhoea, no vomiting and no blood in the stool. |
Information from examination or lab. (The other facilitator provides this information as participants ‘examine’ the child):

- Babu weighs 5.2 kg and is 68 cm in length.
- He appears severely wasted.
- He has no oedema.
- He has a MUAC of 112 mm.
- His dermatosis is severe (+++).
- His axillary temperature is 36.5° C.
- There are no signs of shock: He is alert and his hands are warm. Capillary refill is 2 seconds and his pulse is not weak or fast.
- His blood glucose is 4 mmol/L.
- There are no eye problems.

If a participant is confused about what to do next, tell him/her to look at the Initial Management Chart and see what else needs to be checked.

At suitable points, interject questions such as, ‘What is Babu’s z-score? Does Babu need to be admitted? Does Babu have hypoglycaemia? Hypothermia?’ (Answer: MUAC is < 115 mm, WHF is < −3 z-score and he has severe dermatosis, so needs to be admitted. He does not have hypoglycaemia or hypothermia.)

At the end, be sure to ask: ‘When does Babu need to be fed? What? How often? How much?’ (Answer: Start now! Feed 55 ml of F-75 every 2 hours.) Record this in the ‘FEEDING’ box on the Initial Management Chart.

Explain that Babu will need an antibiotic. Antibiotic choices will be explained later in the module.

6. Exercise C: Individual and group work – Identifying more initial treatments needed and recording on the Treatment Card

Participants should see you for individual feedback after the second case of this exercise (Khama). Giving individual feedback on the first two cases will allow you to see how well each participant understands the material.

When everyone has received individual feedback on the first two cases, do the third case (Ellen) together as a group. After much individual work, this group interaction will be appreciated.

Nurses and nutritionists (as appropriate): If the group seems to understand how to use the Initial Management Chart, follow the instructions given above for all groups.

If the group is having difficulties, ask participants to do only the first case (Yamikani) individually. Then do both Khama and Ellen as a group. Instructions for Ellen are given on the next page. Use a similar process for Khama.
Individual feedback (Yamikani and Khama)

When giving individual feedback, discuss each case with the participant and compare his/her answers to the answer sheet provided in the back of the module. If the participant has made errors, do not simply correct them, but try to find the reason for the misunderstanding and clarify.

Group work (Ellen)

Show an overhead of a blank Initial Management Chart. Ask participants to complete a blank Initial Management Chart as you write on the overhead. Have participants take turns reading aloud the background information given on page 30 in the module. As they read, record the information on the overhead.

Next, ask participants in turn to answer questions 3b–3d of the exercise. Discuss or correct misunderstandings as needed. (Refer to the answer sheet in the back of the module as needed.) When question 3d has been answered, record information about amounts of IV glucose and IV fluids on the Initial Management Chart.

After answering question 3d, continue to the end of the exercise using this process:

1. Ask participants in turn to read the information given about the case.
2. Record on the overhead of the Initial Management Chart while participants record on their forms.
3. Ask participants the questions given in the module and discuss the answers.

Stress the importance of monitoring the child carefully whenever IV fluids or ReSoMal is being given. Emphasise the importance of monitoring every 10 minutes while on IV fluids and every 30 minutes or hour while on ReSoMal. Some participants may feel that such frequent monitoring is impossible; however, it is important because the child may go into heart failure if hydrated too fast. It is critical to quickly notice signs of possible heart failure, such as increasing pulse and respirations. Hospital staff should do their best to monitor at the suggested intervals.

At the end of the exercise, ask participant to verify the answer sheets in the back of the module that includes all three cases.

Ask the group to read pages 33–36 and complete Exercise D.

The Medicines Protocols Job Aids in Annex C will be used in this exercise. The third case (Mtisunge) is optional. You may omit this case if the group is behind schedule or if the antibiotic recommendations in the Case Management Training are inconsistent with those in the local area due to resistance.

Nurses and nutritionists (as appropriate): Most nurses (and certainly nutritionists) do not have responsibility for prescribing drugs. Therefore, they do not need to spend a great amount of time learning how to select antibiotics (section 7.0).

Before completing Exercise D, review the following key points with the group:

- An antibiotic is needed for every child with SAM.
- The choice of antibiotic will depend on the complications present (as well as antibiotic recommendations for the local area).
- The dose should be based on the child’s weight, not age.

Demonstrate how to use the Medicines Protocols Job Aids using the example about Apatsa on page 35 of the module.

Ask participants to complete only Case 1 (Pempho) in Exercise D and then come to you for individual feedback.
7. Exercise D: Individual work followed by individual feedback – Selecting antibiotics and determining dosages

When several drug formulations are listed on Medicines Protocols Job Aids in Annex C, participants should choose the one that is most appropriate and likely to be available in their own hospitals, with the specific formulations. Answers are given in the answer sheets in the back of the module.

Be sure that the participant understands the Medicines Protocols Job Aids. The tables tell what antibiotic drug to use, depending on the presence or absence of medical complications, and in case of resistance, with daily dosages expressed per kg body weight. Other routine medicines for presumptive treatment and/or prevention, and supplemental medicines for other common infections and infestations with indication and dosage are summarized in Annex C, or refer to national or WHO guidelines and treatment protocols.

The dosage of the antibiotic drug calculated per body weight gives a more precise dosing than one based on age.

Remind the participants where antibiotics prescriptions should be recorded on the Initial Management Chart.

Some participants may be concerned about resistance to the recommended antibiotics in their areas. The antibiotic recommendations may be adapted locally if necessary.

When everyone has finished this exercise, the group will see a video about Emergency Treatment. In the meantime, participants can continue work on the module by reading sections 8.0 and 9.0 on pages 40–51 and allow time to discuss. Then participants will complete the written part of Exercise E (page 53).

8. Video: Emergency Treatment

The video can be shown at any point after participants have finished Exercise D of this module. Introduce the video as follows:

*This brief video shows many of the steps described so far in this module. In real life, these steps must occur very quickly, almost at the same time. The video will show an emergency team working together rapidly and efficiently.*

*The video shows that a child will die without immediate treatment. Watch carefully as the team quickly follows emergency procedures. You will see the process once; then you will see it again with commentary.*

After the video, lead a discussion. Ask participants questions, such as the following:

- What did you see the emergency team check for and why? What did you not see them check for? Note: Checking of the eyes is not shown. Use of dextrostix is not shown, but this is not required in this case; when the child is in shock and lethargic, he should get the IV glucose.

- This child has lower chest wall in-drawing and appears to have fast breathing. What are these signs of? (Answer: Severe pneumonia.) What antibiotic should be given? (Answer: benzylpenicillin and gentamicin. If the child responds, complete the treatment; if the child does not respond replace with ceftriaxone until the child improves.)

- What was different from the guidance given in module? Note: The child is left uncovered. This is because he had a fever of 38° C and the room was extremely hot. Usually the child should be covered.

- Can the emergency team at your hospital do these procedures?
Be sure that the following points are raised in the discussion:

- This child is in shock and is unconscious, so he will receive IV fluids. Give IV fluids only when a child is in shock and is unconscious. (Ask: ‘What are signs of shock?’ Answer: Cold hands with slow capillary refill or weak or fast pulse.)

- Notice that glucose, fluids and antibiotics were all given through the same IV line.

- Notice that pulse and respirations are monitored.

- The mask is too big because it covers the child’s eyes. A paediatric mask or nasal catheter would be preferable for a good oxygen flow.

- The skin pinch is done to determine (later) whether rehydration seems to have occurred. We do not know if this child has diarrhoea, and whether the skin pinch test is reliable.

Additional notes: Make these points only if participants raise these questions:

- Participants may ask why the child’s arm is shaking. That is unusual, and the reason is unknown. One would expect the arm to be limp. The shaking may be due to hypoglycaemic seizure.

- Participants may ask why femoral blood is taken. That is also unusual. One would expect blood to be taken from the scalp when the IV is inserted.

- Participants may ask why the team checks for palmar pallor. Health workers were trying to see if the child is anaemic. They should determine the Hb level before deciding on a transfusion. However, they may have been trying to predict the likelihood that the child will need a transfusion.

After the discussion, ask participants to complete the written part of Exercise E.

When everyone is ready, there will be a role-play in which an admitting clinician briefs a head nurse on a child’s conditions and needs.

9. Exercise E: Individual work followed by individual feedback, then role-play and discussion – Briefing staff on a child’s conditions and needs

This exercise should show how the Treatment Card can be a helpful tool in communicating with staff about what has happened during initial management, and what needs to happen during daily care. Participants will need blank copies of the Initial Management Chart for this exercise.

Since this is the first role-play in the Case Management Training, review the general facilitator guidelines about role-plays at the end of this guide on page 71.

When a participant has finished the Initial Management Chart for Melina, he/she should show it to you. Check it quickly and give each participant the Initial Management Chart to fill. Then ask the participant to list points that the admitting clinician should make, and questions that a nurse might ask, as instructed on page 52.

Select a participant to play the role of the clinician and another to play the role of the nurse. For this first role-play, select participants who appear to be confident and comfortable in front of a group. Check to make sure that they have listed some reasonable points and questions in their modules. If necessary, give them some hints from the answers.

Ask the participants playing roles to behave as a normal clinician and nurse might behave. The clinician should refer to the Initial Management Chart for Melina as an aid. The clinician should
inform the nurse what to do next, when to feed the child and how much and so on. The nurse should ask realistic questions that a nurse might have.

During the role-play, other participants should observe and make notes on things done well and suggestions for improvement.

In the discussion following the role-play, be sure that the tone is positive. If some points listed in the answers were not made, mention those points. Inform participants to find the answer sheet in the back of the module.

10. Summary of the module

1. Remind participants of the learning objectives for this module, listed on page 2. The skills taught in this module are those intended to prevent death while stabilising the child. Stress that emergency room staff need to have these skills, along with the knowledge of what to do and what not to do.

2. Remind participants that all children with SAM need antibiotics. The presence or absence of medical complications determines the type of antibiotics. Recommendations may vary locally due to resistance to certain antibiotics in some areas.

3. Stress that the Initial Management is meant to be an aid, to help remember emergency steps. When used as a record, it also is a valuable communication tool.

4. Review any points that you have noted below, and answer any questions that participants may still have. (If you cannot answer a question, offer to obtain more information and discuss it later.)

* If desired, this activity may be done on the half day in the middle of the Case Management Training (day 4), to enable groups from the same hospital to work together.

### Preparing for the module

Early in this module the group will prepare F-75, F-100, and infant formula or F-100 Diluted and discuss the use of RUTF. Note that you will need a dietary scale and possibly a blender or a hot plate for cooking. Water should be boiled and cooled in advance. There may be a designated kitchen area that all of the groups will use. If so, find out whether there is a certain time that your group will use the kitchen area.

You will need copies of the 24-Hour Food Intake Chart and Daily Ward Feeds Chart (or enlarged copies of these forms that can be used for demonstrations to the whole group on how to complete the forms).
1.  **Introduce Module 4**

Explain that this module describes a critical part of managing SAM—that is, feeding. As explained in *Module 2. Principles of Care*, however, feeding must begin cautiously, with F-75 for children 6 months and older, or F-100 Diluted for infants less than 6 months, in frequent small amounts. This module describes how to start feeding during stabilisation, transition and rehabilitation for the cases remaining in inpatient care. This module focuses on preparing the feeds, planning feeding and giving the feeds according to plan.

Point out the learning objectives of this module on page 2.

2.  **Exercise A: Group work followed by group discussion – Preparing F-75, F-100, and infant formula or F-100 Diluted**

Ask participants to read through page 6, including *Annex A* of *Module 4* and *Annex D* of *Module 2*. When everyone has reached that point, the group will prepare F-75 and F-100, and Infant Formula or F-100 Diluted, and discuss the use of RUTF (Exercise A page 8). Instead of demonstrating, engage the participants in the preparation with the assistance of a skilled person.

*(If necessary, preparation of the milk formulae can be delayed until it is time for your group to use the kitchen area. The group can continue work on the module while waiting for a turn in the kitchen area.)*

Make F-75 first and then F-100. Point out differences in the recipes. If you prepare the milk with a local recipe (from the recipes in Annex A), you may prepare one recipe with a whisk/spoon and one with an electric blender to show both methods.

Have participants take turns doing the steps in the recipes (e.g., measuring an ingredient, stirring). Ask participants to notice steps where errors are likely to be made and point these out. After preparing the formulas, let everyone have a taste. (The remaining amount may be used during the next drill or in the hospital ward.)

Discuss with the group such questions as:

- What aspects of preparing these recipes would be difficult in your health facility or hospital?
- How can you make sure recipes are prepared correctly?
- Does any equipment need to be purchased, such as correctly sized scoops or hand whisks/spoons?

After you have finished, discuss the composition of RUTF and how it is used. Let the participants taste the RUTF.

3.  **Reading and short answer exercise**

Participants will read pages 6-7 and answering the short questions (page 8) use the therapeutic milk look-up tables in this section. Be aware that one F-75 look-up table is for children 6 months and older with severe wasting and mild (+) or moderate (+++) oedema, and the other F-75 look-up table is for children 6 months and older with severe (+++) oedema. For infants less than 6 months the look-up tables for breastfed or not-breastfed infants will be used. While participants are working, prepare for the drill below.
4. **Drill: Determining amounts of therapeutic milk to give**

Ask participants to gather around for the drill. They will need their therapeutic milk look-up tables. The purpose of this drill is to practise using the look-up table to determine amounts of F-75 or infant formula/F-100 Diluted to give.

Remind participants of the procedure for drills. You will call on each person in order. If a participant cannot answer, you will go quickly to the next person and ask the question again. Participants should wait until it is their turn and should answer as quickly as they can. It should be a fun, lively exercise.

Begin the drill. Use the case information in the table below. Call out the case information, then ask the first participant to use the job aid and tell how much therapeutic milk should be given. Explain that, unless specified otherwise, the weight given is the weight on admission (or after initial rehydration). Unless otherwise specified, the degree of oedema is also what was present on admission.

If a participant cannot answer or makes a mistake, let the next person try. Keep the pace rapid. You may make up additional cases if needed. Some blank spaces are allowed for this. At several points in the drill, you may stop and have a participant measure out the correct amount from the batch of F-75 and infant formula/F-100 Diluted just prepared. Choose some larger and some smaller amounts to show the range.

</tr>
</tbody>
</table>

After the drill, tell participants that the next section of reading will explain how to record feeds on a 24-Hour Food Intake Chart and on the Daily Care Chart of the Treatment Card. Hold up both of these forms for everyone to see.
The 24-Hour Food Intake Chart will be used to provide the details of each feed of the day. The Daily Care Chart simply provides a brief summary of the feed plan and the amount taken during the day. Participants will use only a small part of the Daily Care Chart at this point, that is, the three lines related to the feed plan. Point out these three lines on the Daily Care Chart.

5. **Reading, demonstration using 24-Hour Food Intake Chart**

Have participants read pages 11-16 of the module about feeding and recording feeds.

**Possible question about low-birth-weight babies**

Low-birth-weight babies are not likely to meet the definition for SAM used in this Case Management Training. They are not usually severely wasted or oedematous. Low-birth-weight babies should be breastfed. Their management is not taught in this Case Management Training. However, feeding of infants less than 6 months with SAM is discussed later in section 5.0 of this module.

**Nurses and nutritionists (as appropriate):** After participants read pages 11-16, ask how they will know if a child needs an NG tube. (*Answer: The child needs an NG tube if he/she does not take 80 percent of the F-75 orally [i.e., he/she leaves more than 20 percent] for two or three consecutive feeds.*)

Help the nurses and nutritionists understand what 80 percent means; 80 percent is ‘almost all’ of the feed. Show examples using a glass of drinking water:

- Put 100 ml of water in a clear glass. Ask a participant to imagine where the water would be after drinking 80 ml and draw a line on the glass at that spot. Then ask her to drink 80 ml. Show the amount left to the group. Ask the group what percentage the participant took (80 percent) and what was left (20 percent). Measure the amount left to see how accurate the participant’s guess was. If about 20 ml is left, the guess was accurate.

- Again put 100 ml of water in a glass and show the amount to the group. This time, have a participant mark where half would be and drink half. Show the group the amount left. Ask participants what percentage was taken (50 percent). Ask participants if enough was taken. It should be clear, just from looking in the glass, that half (50 percent) is less than 80 percent and clearly not enough.

In many cases, it will be obvious whether or not 80 percent has been taken. However, if unsure, one can use simple math or a calculator. To make the calculation, it is important to remember the relationship between percentages and decimal fractions. Write the following on the flipchart:

\[ 80\% = \frac{80}{100} = 0.80 \]

Ask a participant to use his/her calculator to figure out what 80 percent of 60 ml is. (*Multiply 0.80 \times 60 ml. *Answer: 48 ml.*) If 60 ml is offered, any amount less than 48 ml is not enough. (Likewise, if more than 12 ml is left, the child has not taken enough [60 ml – 48 ml = 12 ml].)

Give one more example. A child is offered 75 ml of F-75 orally. Show this amount in a glass. He/she takes 55 ml (pour out this amount) and leaves 20 ml. Show the amount left in the glass. Ask: Did the child take enough? Let half the group judge based on appearance, and the other half by doing a calculation (0.80 \times 75 ml = 60 ml). Compare the results. (*Answer: He/she took 55 ml, which is less than 60 ml [80%] and not quite enough.*)

**Note:** If F-75 is not given in graduated cups or marked glasses, it will take extra effort to measure the amount left after each feeding. Leftovers will need to be poured into a graduated cup or syringe.
for measuring. If a syringe will be used for nasogastric feeding, leftovers may be measured in the syringe, and then dripped through the NG tube.

**Demonstration of 24-Hour Food Intake Chart**

Do the following demonstration to show how a 24-Hour Food Intake Chart can help staff notice feeding problems early. Use an overhead transparency or an enlarged copy of the form and complete the form in front of the group. One facilitator can record while the other tells the following story.

*A girl named Marina weighs 5.4 kg on admission. It is her second day in hospital, and she still weighs 5.4 kg. She is supposed to receive 12 feeds of 60 ml F-75 today. Record this information at the top of the form.*

The feeding day starts at 8:00 and ends at 6:00 the next morning, so the 2-hourly feeding times are: 8:00, 10:00, 12:00, 14:00 and so on. List all 12 feeding times in the ‘Time’ column.

*At 8:00, the nurse offers Marina 60 ml of F-75. She left 5 ml, so the amount taken is 55 ml. She did not vomit any of the feed, and she did not have any watery diarrhoea. Record that 60 ml was offered, 5 ml was left, and 55 ml was taken. Ask: Did she take enough? (Answer: Yes, she took more than 80 percent; 55 ml is ‘almost all’ of 60 ml; 80 percent of 60 ml is 48 ml.) Marina did not need NG feeding, so record 0 in the NG column.*

Tell participants that you are going to continue to record what happened at the next feeds. Ask them to stop you if they think something different should be done:

**10:00** 60 ml offered, 0 ml left, 60 ml taken, 0 NG, no vomiting, no diarrhoea

**12:00** 60 ml offered, 10 ml left, 50 ml taken, no vomiting, no diarrhoea

**14:00** 60 ml offered, 0 ml left, 60 ml taken, 0 NG, vomited 30 ml, no diarrhoea

**16:00** 60 ml offered, 20 ml left, 40 ml taken, 0 NG, no vomiting, no diarrhoea*

* If no one stops you, go on to record the next feed. Someone may stop you here and suggest NG feeding. Since Marina took all of the previous feed before vomiting, it may be best to wait one more feed before deciding to put in an NG tube.

**18:00** 60 ml offered, 30 ml left, 30 ml taken, 0 NG, No vomiting, No diarrhoea**

** Someone should stop you here and suggest that an NG tube be used. The child vomited half of the 14:00 feed and took less than 80 percent of the next two feeds. Night is coming, and she will need to be fed well through the night or she is likely to become hypoglycaemic. If no one stops you, record more feeds in which Marina takes less than 80 percent. Someone should stop you soon.

Discuss the point of this demonstration, which is that staff should not simply record the feeds; they should also notice feeding problems and act promptly by calling a clinician or using an NG tube to finish feeds. They should not wait 24 hours between noticing a problem and taking action.

**6. Short answer exercise**

Have participants read and complete a short answer exercise about feeding and recording feeds on the 24-Hour Food Intake Chart on page 18 of the module. They can check their own answers in the answer sheet on page 64 of the module.
Nurses and nutritionists (as appropriate): Although participants can check their own answers to the short answer exercise, a facilitator should check the answers of any participant who seems to be having difficulty.

7. Exercise B: Individual work followed by individual feedback – Determining F-75 feeding plans for the next day

Ask participants to read and complete the four cases on pages 20–28 of Exercise B. In this exercise, participants will need to refer to the criteria for increasing volume/decreasing frequency of feeds on page 9 of the module. These criteria could be repeated as footnotes at the bottom of the F-75 look-up table.

After giving individual feedback, be sure to inform participants to find the answer sheet in the back of the module. It is important to finish Exercise B by the end of day 3 if possible. (Some groups may be able to finish Exercise C.)

Nurses and nutritionists (as appropriate): Have the nurses (and nutritionists) complete Cases 1 and 2 (Dalitso and Peter) of Exercise B independently and come to you for individual feedback.

Complete Case 3 (Rose) orally as a group.

If the group is working slowly, Case 4 (Sakina) may be omitted. Alternatively, you may use Sakina as another demonstration in which participants stop you when an NG tube is needed. Describe Sakina’s first 2 days in hospital (page 27 of the module). Put up a blank overhead of the 24-Hour Food Intake Chart and use the information on page 9 to complete it, feed by feed, for Sakina for day 3. Participants should stop you and tell you to insert an NG tube at 22:00 or 24:00, when Sakina feeds poorly for the second or third time. If they stop you, congratulate them for doing better than Sakina’s ‘real’ nurses (and nutritionists), who let her go for the rest of the night without food. Discuss Sakina’s feed plan for day 4.

8. Exercise C: Individual work followed by individual feedback – Feeding RUTF or F-100 during transition

Ask participants to continue doing individual work by reading pages 29–32 and completing Exercise C (pages 33–36). If it is already the end of day 3, Exercise C may be assigned for homework to be done on the middle day of the Case Management Training (day 4). The Course Director will inform you of any other work to be done on day 4. For example, participants from the same health facility or hospital may work together on Exercise E (preparing a NRU schedule) or there may be an opportunity to observe a play session or an education session with mothers.

If Exercise C is given as homework, remember to give individual feedback when the group returns. When giving individual feedback, be sure that participants understand the importance of giving RUTF or F-100 slowly and gradually during transition. In case not all the amount of the RUTF-feed is eaten, the missed amount of the feed should be completed with F-75 or F-100. For instance 18 g (rounded to 20 g) of missed RUTF can be replaced by 130 ml of F-75 or 100 ml of F-100. This may be necessary for the first day the child is on RUTF. Share with the participants that it is very common that the child with returned appetite takes all RUTF from the first feed.
Be sure that they understand the careful and gradual feeding of high-energy therapeutic foods during transition to rehabilitation. Monitoring is very important during transition.

**Possible question.** Participants may ask if it is permissible to give a child more RUTF or more F-75 or F-100 if he/she is crying with hunger. During transition, it is very important to be cautious. If 4 hours is too long for a child to wait between feeds, it is fine to give 3-hourly feeds, keeping the total daily amount the same. If a child continues to cry for more, it is acceptable to give more only if the staff is able to monitor the child very closely for danger signs. Later, after transition, more food can be given according to the child’s appetite without the need for such close monitoring. Highlight that the monitoring of danger signs will be covered in **Module 5. Daily Care.**

Distribute answers to the exercise at the end of each exercise.
9. **Exercise D: Individual work followed by individual feedback – Feeding on RUTF and free-feeding on F-100 in rehabilitation**

Ask the participant to continue doing individual work by reading pages 37–38 and completing Exercise D (pages 39-44). Explain that the RUTF and F-100 look-up tables will be used in Exercise D.

**Nurses and nutritionists (as appropriate):** Instead of having the nurses and nutritionists read section 4.0 (pages 37–44) individually, you may talk through this section.

Hold up the F-100 look-up table for rehabilitation. Explain that, if the child remains on F-100 after transition, the look-up table F-100 in rehabilitation is used to determine the appropriate range of feeds of F-100. Point out that the first set of ranges is for 4-hourly feeds of F-100, the second set of ranges is for daily volumes. The child can have as much as desired within these ranges.

Carefully talk through the important points on pages 37-38 of the module. (Omit the alternative methods of calculating the range for Delia.) Give examples of children who have finished transition, and ask participants to tell you what to write on the top of the 24-Hour Food Intake Chart.

**Examples**

Weight 6.4 kg, finished all feeds yesterday, last feed was 200 ml
Write: *Give 6 feeds of 210 ml. Do not exceed 235 ml.*

Weight 8.3 kg, did not finish feeds yesterday, last feed was 250 ml
Write: *Give 6 feeds of 250 ml. Do not exceed 300 ml.*

(Nota e that the range for the next lower weight was used, 8.2 kg.)

In Exercise D, do Cases 1 and 2 (Dalitso and Peter) orally as a group. Ask participants to do Case 3 (Rose) independently and come to you for individual feedback.

When giving individual feedback, be sure that the participant understands how to use the look-up tables. The child should be gaining weight at this point, and the child’s current weight should be used to determine the appropriate range of volume for feeding. Within this range, the child’s appetite determines how much to offer.

Distribute answers to the exercise at the end of each exercise.

10. **Exercise E: Group discussion – Management of SAM in infants less than 6 months**

Ask the participants to read pages 45–51 of the module.

When giving feedback in group, be sure that the participants understand that infants less than 6 months never receive F-100 but expressed breast milk (if breast milk banks are available), infant formula, or F-100 Diluted, and F-75 only in case of oedema. Ensure that participants are comfortable with breastfed infants being supplemented by the different techniques with the aim to restore breastfeeding, and that, therefore, amounts of supplements gradually decrease, and with non-breastfed infants following a very different protocol. Allow time to develop a feeding plan for the two cases described in Exercise E, and be alerted for participants’ understanding and fill in knowledge gaps as is needed.
11. Exercise F: Preparing a schedule for activities on the ward followed by group discussion

Groups from the same hospital may do this exercise on day 4. If they do, you may be assigned to facilitate a hospital group for this exercise rather than your usual small group.

Ask the participants to read pages 53–55 of the module. Explain that Exercise E involves making a schedule for the ward; use the Daily Feeds Chart. If arrangements have been made so that participants from the same hospital can work together on Exercise E, explain these arrangements.

Depending on how much time is available, you may need to fix a time limit for this exercise. One hour may be suitable. Stress that the schedule does not have to be perfect. This is an opportunity to discuss options and make up a possible schedule.

Some participants may feel that they have no power to change the schedule at their hospitals. If this is the case, suggest that they develop a schedule that accepts that some things cannot change, but perhaps others in the hospital might be able to make some changes if they were convinced the changes are important.

When most people are ready, lead a group discussion. (Some participants may wish to continue work on their schedules later on their own). Ask participants:

- Was there a need to adjust shifts, kitchen hours or other aspects of your hospital’s schedule to accommodate feeds? What adjustments did you make?
- How did you provide times in the schedule for play and educating mothers about feeding their children?

Inform participants to check the answers in the back of the module on page 64.

12. Exercise G: Individual work followed by individual feedback – Planning feeding for the ward

Ask participants to continue reading pages 57–58 and complete Exercise G (pages 59–60). In this exercise, participants complete a Daily Feeds Chart by adding three children to the chart and doing the calculations at the bottom of the form.

Nurses and nutritionists (as appropriate): If you think that participants will have difficulty with the Daily Feeds Chart, use an overhead transparency or an enlarged copy of the form to show the group how to complete the form. Follow the instructions on page 59 as you demonstrate completing the form. You may use the information in the example on page 60.

After the exercise, conduct individual feedback as usual.

Distribute answers to the exercise at the end of each exercise.

13. Exercise H: Group discussion – Preparing staff to do tasks related to feeding

Ask the participants to read pages 61–62 and prepare for the discussion in Exercise H (page 63). The discussion will focus on ways to prepare hospital staff to do new tasks related to feeding.

Before leading this discussion, review the general guidelines for leading group discussions given at the end of this Facilitator Guide.
Use the questions given in the exercise (page 63) to structure the discussion. In answering the questions, try to focus on one task at a time. For example, you may discuss how to prepare staff to do one of the following tasks:

- Prepare F-75, F-100 and F-100 Diluted
- Measure F-75, F-100 and F-100 Diluted
- Define daily and feed amounts of RUTF
- Record feedings on a 24-Hour Food Intake Chart
- Feed through an NG tube

The above are specific tasks. If you try to discuss ‘feeding’ as a whole, the discussion will become general and less helpful.

Of course, answers will vary greatly. Participants may have some very creative ideas. As a model, here are some possible answers to the questions on page 63 of the module, focusing on one task.

**Examples**

1. Nurses and nutritionists do not know how to prepare F-75, F-100 or F-100 Diluted.

2. Nurses and/or nutritionists on duty at 7:00 and 19:00 will be responsible for this task. Two nurses and nutritionists from each of these shifts need to be selected to be responsible for preparing feeds. They need to be informed by the head nurse.

3. Information can be provided by written recipes.

4. Examples can be provided by demonstrations. A skilled person should demonstrate how to prepare the recipes.

5. The nurses and nutritionists should have supervised practice. A skilled person watches them prepare the recipes and corrects any problems.

6. A problem might be lack of ingredients. The kind of milk available might vary from day to day. Several recipes should be available for different kinds of milk. Training should be provided in how to make all of these recipes.

**14. Summary of the module**

1. Point out that participants have learned about planning feeding for individual patients and for the ward. It is important to set aside a planning time every day. Once each patient’s 24-Hour Food Intake Chart is reviewed and plans made for the day, then a Daily Feeds Chart can be completed for the entire ward.

2. Remind participants of the importance of:
   - Starting with small, frequent feeds of F-75
   - Having a gradual transition to RUTF or F-100 during a maximum 3 days
   - Adjusting the feeding plan on RUTF, F-100 or F-100 Diluted as the child’s weight and appetite increase, and the child or infant is ready for discharge from hospital

3. Stress the need to carefully prepare hospital staff to do new feeding tasks.
4. Provide a summary on how to manage infants less than 6 months with SAM, breastfed and non-breastfed, and underline how the feeding management of the breastfed infant is very different as the aim is to re-lactate on breastfeeding only.

5. Review any points that you have noted in the box below. Answer any questions that participants may still have. (If you cannot answer a question, offer to obtain more information and discuss it later.)

### Preparation for the module

Be sure that you have a supply of blank Daily Care Charts and Monitoring Charts in the classroom. Each participant will need one of each of these forms for exercises in the module.

1. **Introduce Module 5**

   Explain that this module will focus on the routine tasks, besides feeding, that occur in the ward each day. These tasks, such as bathing, weighing and giving eye drops and antibiotics, are very important for a child’s recovery.

   This module also focuses on monitoring the vital signs of a child with SAM, specifically monitoring pulse, respiration and temperature. Monitoring is critical so that problems can be identified and treatment can be adjusted as needed. Monitoring will allow assessing the response to treatment or failure-to-respond to treatment, and guiding the adaption of the treatment plan if needed.

   Point out the learning objectives on page 1 of the module. Most of these tasks will be practised on the ward. In the module, participants will learn to use three pages of the Treatment Card: the Daily Care Chart, the Monitoring Chart and the Weight Chart. Hold up the enlarged copies.
2. **Reading, short answer exercise, demonstration**

Ask participants to read through page 5 of the module, including completing the short answer exercise on page 3-4 and checking their own answers. Tell them that, after the short answer exercise, there will be a demonstration of how to use the Daily Care Chart.

**Demonstration of Daily Care Chart**

*Note:* The focus of this demonstration is on how to use the chart, not on the treatments, which will be discussed later in the module.

Show an overhead (or enlarged copy) of the Daily Care Chart. Point out that one column is used every day. There are enough columns for 21 days or 3 weeks.

Point out the items in the left column on this page. Not every child will have something recorded for every item. For example, some children will not have eye problems. When a row will not be used, it can be shaded out, or you can write ‘NONE’.

Some items on the Daily Care Chart require that information be recorded (e.g., the child’s weight, the degree of oedema, the volume of feed taken). Others require that the staff sign when a task is performed. For example, when a nurse gives an antibiotic, he/she should sign the form.

Write on the overhead or enlarged copy to set up a Daily Care Chart for a 2-year-old girl named Atuweni. You will set up the left column of the form like the example on page 5 in the module by entering appropriate times and doses. You will also record information for Atuweni’s first day in hospital. Talk as you write, for example:

- Atuweni’s first day in hospital is 8 January, so I record the date as ‘8 Jan’ for day 1.
- Atuweni’s weight is 8.8 kg.
- She has no oedema, so I record ‘0’.
- Atuweni has diarrhoea, but no vomiting, so I record only ‘D’. (If she had vomiting only, I would record ‘V’. If she had diarrhoea and vomiting, I would record both ‘D’ and ‘V’.)
- She will be taking F-75.
- She will be fed on a 2-hourly basis, so I record that she will receive ‘12 feeds’ daily.
- At the end of the day, or the next morning, I will record the total volume that she took during day 1. *(Question: Where can I find the total volume? Answer: On the 24-Hour Food Intake Chart).*
- Atuweni has a medical complication (severe dermatosis) so she will receive benzylpenicillin 450,000 IU (IV) every 6 hours for 2 days followed by oral amoxicillin 135 mg every 8 hours for 5 days, and daily single dose of gentamycin 70 mg (IV or IM) for 7 days, so I record the name of the drug, the dosage and times for the drugs as needed. I draw a box to show that benzylpenicillin should be given for 2 days, amoxicillin for the following 5 days, and gentamycin for 7 days. The box will show the nurses when to give the antibiotic and when to stop giving it. For Atuweni it is necessary to draw several boxes for the different drugs.
- I give Atuweni her first dose of benzylpenicillin and gentamycin and sign the form to show that it has been given at 10:00. Someone else will give the next dose of benzylpenicillin and sign at 16:00 and 22:00 and so on.
- Atuweni has not had a dose of vitamin A in the past month, but she has no eye signs and no measles. She is 2 years old, so she will not need a treatment dose of Vitamin A (and not a
preventive dose since she received commercial F-75). (Explain that participants will learn more about when to give vitamin A later in this module. Do not discuss vitamin A now.)

- She has no worms, so I write ‘NONE’ by ‘drug for worms’, but she will receive presumptive treatment after 1 week in treatment. So I write Albendazole 100 mg single dose on day 8.

- Atuweni’s dose of iron will be 0.75 ml, given twice daily at 8:00 and 20:00, starting from being on F-100 for 2 days. Notice that spaces are shaded out to show that iron should not be given early in treatment. Note that if she will be on RUTF, iron supplementation will not be necessary. (Note that on day 6 and 7 Atuweni was given F100 because she could not tolerate during transition to RUTF).

- Atuweni needs tetracycline ointment or chloramphenicol drops, so I circle that and write that drops should be given at 8:00, 14:00, 20:00 and 2:00 in case of chloramphenicol, or 8:00, 16:00 and 00:00 in case of tetracycline. I indicate that the drops are needed in her left eye. Atuweni does not need atropine, so I write ‘NONE’. (Explain that participants will learn about treatment for eye problems later in this module. Do not discuss treatment of eye problems now.)

- I give Atuweni a drop of chloramphenicol in her left eye and sign the form. Other nurses will give the later doses and sign.

- I record +++ to show that Atuweni has severe dermatosis. I circle that she will need bathing with 1 percent permanganate. Atuweni is too sick to be bathed today, but I sponge 1 percent permanganate solution on the oozing spots and dress them with gauze. Then I sign the form.

Participants can see how Atuweni’s Daily Care Chart was filled for 9 days by looking at the example on page 5 of Module 5.

3. **Reading and short answer exercise**

Ask participants to read pages 6–9 of the module and complete the short answer exercise. The short answer exercise is about vitamin A. Look to see that participants are completing it correctly.

**Note:** Participants may ask why children with signs of eye infection (pus, inflammation) need additional doses of vitamin A. The reason is that pus and inflammation may hide the signs of vitamin A deficiency.

**Nurses and nutritionists (as appropriate):** Before participants complete the short answer exercise on page 10, review the guidelines for giving vitamin A on page 8 and answer any questions. It may be helpful for the group to complete the short answer exercise together orally. To complete this exercise as a group, ask each participant in turn to answer a question.

If participants complete the short answer exercise independently, you may want to give individual feedback to ensure that each participant understands when to give vitamin A.

4. **Reading and Exercise A: Individual work followed by individual feedback – Deciding on treatment for eye signs**

Ask participants to read pages 11–13 of the module and complete Exercise A on treatment of eye problems.

**Nurses and nutritionists (as appropriate):** Before the exercise, review the table on page 13 of the module with the group and answer any questions. Explain that in Exercise A, they will need to refer to the tables about vitamin A on pages 8 and to the table about eye drops on page 13.
Have your Photographs booklet out when you give individual feedback, to show photos of blinding eye signs.

The next exercise will be done as a group. Those who have received feedback on Exercise A may continue reading in the module until everyone is ready for Exercise B.

5. **Exercise B: Group work followed by group feedback – Using the Daily Care Chart of the Treatment Card**

The purpose of this exercise is simply to set up a Daily Care Chart properly. Although the exercise could be done individually, it will be easier and more interesting if done as a group.

Give each participant a blank Daily Care Chart. Participants will complete this page as you prompt them. After each prompt, allow enough time to record, but do not go so slowly that participants become bored. If you see that a participant is not writing, look to see what the problem is and explain.

First ask everyone to look at the Initial Management Chart for Bwerani on page 17 of the module. Most of the information needed about Bwerani is on her Initial Management Chart. Bwerani has SAM and has been admitted to the NRU. Ask participants to look for her date of admission.

Ask them to record this date for day 1 on the Daily Care Chart. Then continue prompting as follows:

- Look for Bwerani’s admission weight on the Initial Management Chart. Record this as her weight for day 1.
- Record Bwerani’s degree of oedema.
- Record whether or not she has diarrhoea or vomiting.
- Record the type of feed that she should be given on day 1.
- Record the number of feeds that Bwerani should receive on day 1.
- You do not know how much she will take during the day, so leave the ‘total volume taken’ blank.
- Look at the antibiotics that Bwerani will receive. Recorded on the Initial Management Chart, these are: benzylpenicillin IV for 2 days followed by oral amoxicillin for 5 days and gentamycin for 7 days.
- Notice the times that medications are given on the ward. These are listed on page 16 of the module: 8:00, 14:00, 16:00, 20:00, 24:00, 2:00.
- On the Daily Care Chart for Bwerani, write the dose of benzylpenicillin followed by amoxicillin, and gentamycin, the route of administration and the time it will be given, and draw a box to show when it should be given. *(Do not sign the form yet. You are simply setting up the form, not giving the drugs.)*
- Record the provision of the single dose of that will be given.
- Record the dose of vitamin A that Bwerani needs.
- Bwerani does not have worms, so write ‘NONE’ by ‘drug for worms’ or shade the boxes. Bwerani will receive presumptive treatment after 1 week in treatment. So I write Albendazole 100 mg on day 8, 9 and 10.
- Look at the information on Bwerani’s eye signs given on the Initial Management Chart. Decide what type of eye ointment or eye drops, if any, Bwerani needs. Record the type(s) of eye ointment or drops and the times to give them. *(Allow more time here since participants will need to record times to give two drugs.)*
• Record Bwerani’s dermatosis classification and circle whether she needs to be bathed with potassium permanganate.

• Bwerani has pus draining from her ear, and it needs to be wicked at least twice daily. Indicate this need on the Daily Care Chart at the bottom.

Inform participants that the answer sheet for this exercise will be distributed at the end of the exercise. Each participant will compare his/her form to the answer sheet. Discuss any differences or any questions that participants may have.

Note: The times selected by participants for wicking the ear may vary, although 8:00 and 2:00 seem logical choices given the times that nursing rounds are done in this example. Wicking should actually be done as often as needed, but by marking certain times on the form, it is more likely to be done.

6. Demonstration, reading and short answer exercise

Participants will learn about use of the Monitoring Chart in this section. Have participants read the first three paragraphs on page 18 of the module (or orally cover the points in these paragraphs).

Demonstration of Monitoring Chart

Put up a blank overhead of the Monitoring Chart (or use an enlarged copy).

Point out that a child’s respiratory rate and pulse rate are recorded at the top, and temperature is graphed so changes can easily be seen. This monitoring should be done every 4-hours until the patient is stable on RUTF or F-100 in transition. One page can be used for about 7 days if monitoring is done this frequently. If necessary, additional pages can be attached.

Use the following story to show how the form is completed. One facilitator can read the story of Dziko while the other facilitator records:

• Dziko’s axillary temperature at 9:00 on day 1 is 36.0°C. (Plot temperature with an ‘X’ on the line for 36°C in the middle of the left-most column of the graph. Record time below the column.)

• Dziko’s respiratory rate is 35 breaths per minute. Record in left-most box at top of form. His pulse rate is 90 beats per minute. Record pulse rate below the respiratory rate. Point out that the temperature is recorded on the horizontal line midway between the vertical lines that separate the dates.

• Dziko’s axillary temperature at 13:00 is 36.5°C. His respiratory rate is still 35 and his pulse rate is 95. Record these on the Monitoring Chart. Connect the points for the temperature graph.

• Dziko’s axillary temperature at 17:00 is 37°C. His respiratory rate is still 35 and his pulse rate is back to 90. Record these on the Monitoring Chart. Connect the points for the temperature graph. Point out that it is easy to see the increase in temperature.

Explain that participants will practise using the Monitoring Chart in the next exercises. Point out the example of a Monitoring Chart on page 22 of the module.

Ask participants to continue reading pages 18–22 and then complete the short answer exercise on page 23.

Nurses and nutritionists (as appropriate): Review the Summary of Danger Signs on page 20 of the module with the group, as well as the other danger signs listed on the same page.

After the group has done the short answer exercise independently, review the answers with them as a group.
7. Exercise C: Individual work followed by individual feedback – Use of the Daily Care Chart and Monitoring Chart

In this exercise, participants will make entries on the Daily Care Chart that they set up for Bwerani in Exercise B. If their own work was correct, they may make entries on the form that they set up earlier. If there were many mistakes, they may use the answer sheet provided for Exercise B in the back of the module instead of their own work.

Participants will also need a blank Monitoring Chart for this exercise.

Give individual feedback as usual. The purpose of this exercise is mainly to learn how to use the forms. In the next exercise, participants will practise interpreting the Monitoring Chart to identify danger signs. Point out that the set of job aids includes Monitoring Danger Signs Job Aid.

Inform participants that a copy of the answer sheet will be provided at the end of the exercise.

Nurses and nutritionists (as appropriate): Exercise C may be done as a group exercise in the same way that Exercise B was done. Read aloud the information about Bwerani as each participant records on a Monitoring Chart. If necessary, a facilitator may simultaneously record on an overhead of the Monitoring Form. Discuss the questions at the end of the exercise. Inform participants to look at the answers provided at the end of the exercise.

8. Exercise D: Individual work followed by individual feedback – Reviewing Monitoring Charts to identify danger signs

Ask the participants to complete Exercise D. This is a very important exercise. The Monitoring Charts illustrate several different danger signs. At the end of individual feedback, review these danger signs with the participants:

- Bwerani – sudden drop in temperature (possibly became uncovered or missed a feed, possible infection)
- Karen – increase in both respiratory and pulse rates (possible heart failure)
- Beni – temperature increase, fast breathing (possible pneumonia)

Monitoring is recommended every 4 hours until the patient is stable after transition. Ask the participant whether he/she thinks that monitoring can be done every 4 hours in his/her hospital. If not, how often does the participant think that monitoring can be done?

Inform participants that an answer sheet will be provided at the end of the exercise. He/she may continue to read and work independently on the module.

Nurses and nutritionists (as appropriate): Complete Case 1 of Exercise D (Bwerani) as a group. Then have participants continue the exercise independently. Give individual feedback on Karen and Beni.

9. Regaining of appetite and introducing RUTF

Participants will be reminded that an improving appetite is a result of a general improving medical condition: The child’s medical complication is resolving, the child is alert.
Monitoring the improvement of the appetite guides the decision for the transfer to the transition phase, where they will be offered RUTF at every feed. The RUTF feed will be completed with therapeutic milk (F-75 or F-100) if required, until the child eats the amount of RUTF at every meal prescribed for his/her weight.

In special cases where no RUTF is available, the child will receive F-100 in the same amounts and at the same times as during stabilisation until the feeds are taken well and the child is ready for rehabilitation.

10. Optional demonstration, reading and short answer exercise

Section 7.0 of the module describes how to complete a Weight Chart for a child with SAM. Most clinicians will be familiar with weight charts and will be able to work independently to the end of the module without a demonstration. If you anticipate that your group will find the weight chart difficult, however, you might want to demonstrate how to complete it. When appropriate, nurses (and nutritionists) groups could have a demonstration.

Optional demonstration of weight chart

Use an overhead transparency or an enlarged copy of the weight chart. Point out that the vertical axis shows the possible range of weights for the child, and the horizontal axis shows the days that the child is in hospital. Each point plotted on the graph on the vertical line that indicates the day shows the child’s weight on a certain day.

One facilitator should tell the story of a child and describe the graphing process using the italicised narration below. The other facilitator should record information, label the graph and plot weights following the directions given in regular type below:

- Oliver is a 9-month-old boy. His weight on admission is 6.1 kg, his length is 67.0 cm and his MUAC is 112 mm. He has moderate (+++) oedema on admission. Oliver has oedema with severe wasting and is admitted to inpatient care. Record this information in the spaces to the left of the weight chart.

- What is the desired discharge weight for Oliver? Look it up on the discharge weight look-up table. Participants should find that Oliver’s desired discharge weight (15 percent target weight) is 7.0 kg. Record this to the left of the weight chart.

- Now we need to set up the vertical axis of the graph. Point to the vertical axis. Each heavy line going across represents a whole number weight, such as 5.0 kg, 6.0 kg and so on. Each lighter line represents 0.1 kg. Point to the heavy lines and lighter lines.

- Since Oliver has some oedema, he will lose some weight before he gains any weight. So we cannot put his starting weight at the bottom of the vertical axis. We have to leave some room for weight loss. Since Oliver has moderate oedema, we will allow for 1 kg weight loss. If he had severe oedema, we would allow for a 2 kg or 3 kg loss (depending on his age). His starting weight is 6.1 kg, so we will write 6.0 kg by the first heavy line up from the bottom of the chart; 6.1 kg will be on the first light line above this. Label the heavy line ‘6.0 kg’.

- We can now label the other heavy lines that intersect the vertical axis. There is no need to label the lighter lines. We will just remember that each one represents 0.1 kg. Label the remaining heavy lines 5.0 (bottom line), 7.0 kg, 8.0 kg and 9.0 kg (top line).

- Now the graph is set up. We can plot the admission weight of 6.1 kg. To do this, we follow the line up from day 1, and across from the weight 6.1 kg, and make a mark at the intersection. The mark can be a heavy dot or an ‘X’. Point to show how to find the intersection of lines above day 1 and across from weights 6.1 kg. Make a mark, such as an ‘X’ to plot the point.
On the next day, we would plot a point for the weight on day 2. The weight on day 2 is the same, 6.1 kg. We then connect the points with a line. Plot a point for this weight and connect the points.

On day 3, Oliver has lost some weight. He weighs 5.9 kg. Plot the weight for day 3 and connect the points.

On day 4, Oliver has lost some more weight. He weighs 5.5 kg. He starts F-100 on day 4. Plot the weight for day 4 and connect the points. Underneath the point for day 4 write ‘F-100’.

On day 5, Oliver has gained some weight. He weighs 5.6 kg. Plot the weight for day 5 and connect the points.

On day 6, Oliver has gained some more weight. He weighs 5.7 kg. Plot the weight for day 6 and connect the points.

Over the next days, Oliver continues to gain weight. Plot points for day 7 (5.8 kg), day 8 (5.9 kg), day 9 (5.9 kg) and day 10 (6.1 kg). Connect the points.

You can easily see from looking at the graph that Oliver first lost some weight due to reduced oedema fluid and then gained weight once he started on F-100. Point to show the line going down and then up again.

Participants should read pages 32–33 and complete the short answer exercise on pages 34–35. They should check their own answers and continue to Exercise E (pages 36–37).

Nurses and nutritionists (as appropriate): Facilitators may want to check answers to the short answer exercise individually to be sure that nurses (and nutritionists) understand how to read the weight chart.

11. Exercise E: Individual work followed by individual feedback – Preparing a weight chart

When giving individual feedback, be sure that participants understand why Daniel lost weight, i.e., that he was losing oedema fluid. Remind participants that children are not expected to gain weight until they are on RUTF and/or F-100.

Ask participants whether weight charts like this one are kept in their hospitals. Ask if they can see the usefulness of this type of chart in showing a ‘picture’ of weight gains and losses.

Inform participants to find the answer sheets provided at the end of the exercise.

12. Summary of the module

1. Ask participants to tell you why it is important to keep good records of daily care, weights and results of monitoring. They may have a number of ideas. For example, good records are important for communicating with other staff (e.g., when the shift changes). Monitoring is important to quickly identify danger signs.

2. Review the learning objectives on page 1 of the module and explain that participants will have a chance to do some of these tasks during clinical practice.

3. Review any points that you have noted below, and answer any questions that participants may still have. (If you cannot answer a question, offer to obtain more information and discuss it later.)

Preparation for the module

Calculators will be very helpful for some of the written exercises in this module.

Exercise E of this module is a role-play of a problem-solving session. A problem is described in this guide. Several roles are also described. You will need to photocopy the role descriptions and provide them to participants who will play those roles.

(Optional): If the problem-solving role-play in Exercise E is successful, and if time allows, you may lead an additional role-play using a real problem observed in the hospital ward. So be alert during clinical sessions to identify any problems that might be discussed.

If time allows, during the clinical sessions on day 6, participants will complete monitoring checklists (Supportive Supervision Checklist and Quality Improvement Form).
Exercise F will require empty monthly reporting sheets.

1. **Introduce Module 6**

Monitoring is important both for identifying progress and for identifying problems and/or failure to respond to treatment. This module focuses on monitoring as a way to identify problems so that they can be solved.

First, the module describes a general process of QI. Next, the module shows how monitoring individual progress, weight gain and care can identify problems. Then, the module shows how to identify problems by monitoring weight gain and patient outcomes on the whole ward. Finally, the module discusses monitoring of ward procedures.

Point out the learning objectives on page 1 of the module. Stress that an important concept in this module is to look for the cause of a problem before deciding on a solution. The example on pages 2–3 shows the importance of this concept.

2. **Reading and short answer exercises**

Ask participants to read through page 12 of the module and complete the short answer exercises on pages 4 and 12.

As participants work individually, notice whether they are doing the short answer exercises easily. If they are having difficulty, assist as needed.

The short answer exercise on page 12 is about calculating daily weight gain. A calculator will be very helpful.

**Nurses and nutritionists (as appropriate):** Divide the reading into shorter segments and check understanding after each segment as follows:

- Have participants pause on page 4. Do the short answer exercise together as a group.
- Have participants pause at the end of page 7. Discuss the examples of causes and solutions on page 6. Be sure that participants understand the concept that the solution to a problem must be appropriate for its cause.
- Have participants pause after the example of page 10. Following the process described for calculating daily weight gain, use the flipchart to present the example on page 10 for the group. You may also wish to do the first problem of the short answer exercise on page 12 as a demonstration for the group.
- Have participants complete the short answer exercise on page 12 independently. Individually check participants’ answers to the short answer exercise.

3. **Exercise A: Individual work followed by individual feedback – Identifying progress and problems with cases**

**Nurses and nutritionists (as appropriate):** Before this exercise, review with participants the criteria for failure to respond on page 11. Stress that these are listed merely as a guide to identifying problems. There may be other signs of problems as well.

Nurses and nutritionists should just do Case 1 (Neli) in Exercise A. Omit Case 2 (Limbani).
Participants may give slightly different answers from those on the answer sheets. They may find additional evidence of progress or problems. Their answers should be similar to those given and should be reasonable.

For some of the signs of progress or problems listed by the participant, ask ‘How do you know this?’ The participant should be able to show where he/she got the information from the Treatment Card.

For example, it is important to note that Neli is not eating well. This is evident on her 24-Hour Food Intake Chart. It is also important to notice that Neli has not started to lose her oedema even on day 5. This is evident on the Daily Care Chart.

It is important to note that Limbani is not gaining weight on F-100. One can see this by looking at the recorded weights on the Daily Care Chart and by looking at Limbani’s weight chart.

According to the possible criteria on page 11 of the module, both Neli and Limbani are failing to respond. These criteria are simply a guide to help identify children that are having problems. Inform participants to check the answers of Exercise A at the end of the exercise.

4. Exercise B: Individual work followed by group discussion – Identifying causes and solutions of problems

Nurses and nutritionists (as appropriate): Nurses (and nutritionists) groups should just do Case 1 (Neli) in Exercise B. Omit Case 2 (Limbani).

Be sure that participants prepare individually for Exercise B by writing answers to the questions listed.

Use the questions in the module (pages 26–27) to structure the discussion. Use the answers to Exercise B in the back of the module as a guide for possible answers. If participants do not raise the ideas listed in the answers, mention them yourself.

Stress that the causes are just possible causes. Investigation will be needed to determine the real causes.

Note of caution related to Case 2 (Limbani). Tuberculosis (TB) is often over-treated in children with SAM. Participants should not be too eager to jump to a diagnosis of TB just because a child is not gaining weight. Usually, if a child is not gaining weight on RUTF or F-100, the reason is inadequate intake. The clues in this case are as follows: the antibiotic treatment is not helping, there is no weight gain in spite of good intake, a chest x-ray shows a shadow on the lungs and there is a household contact who has TB.

Stress that low weight gain is usually due to inadequate intake, so always check intake first!

At the end of the discussion, ask participants to verify answers on the answer sheets in the back of the module.

5. Exercise C: Individual work followed by group discussion – Determining whether there is a problem with weight gain on the ward

Ask participants to read pages 28–29 of the module and complete Exercise C to prepare for a group discussion. This exercise focuses on monitoring weight gain for the ward as a whole. Since only children 6–59 months on RUTF and/or F-100 during transition or rehabilitation and breastfed infants
less than 6 months from day one, and not-breastfed infants less than 6 months during transition or rehabilitation are expected to gain weight, participants will look at weight gain only among these children and infants.

Completing the Weight Gain Tally Sheet for the ward may seem like a cumbersome process to some participants. Point out that it needs to be done only once a month, preferably for the same week each month. The tally sheets can be a good basis for discussion and problem solving with staff.

As participants do individual work to prepare for the discussion, they may ask you to check their calculations and their tally sheets. Do so using the first part of the answers of Exercise C provided in the back of the module. (Ask participants not to look at the answers yet but wait until after the group discussion.)

Be sure that participants prepare for the discussion by writing answers to questions on page 32. Use these questions to structure the discussion. Participants should raise the points given on the answer sheet. If they do not, raise these points yourself.

Other possible questions to discuss:

- Do you think that the problem of poor weight gain on this ward would have been noticed without completing a tally sheet?

- Is it practical to use this process (calculating and tallying weight gains) once a month in your hospital for patients during rehabilitation? If not, how could you still be aware of problems?

6. **Exercise D: Individual work followed by group discussion – Determining common factors in deaths**

Ask participants to read pages 34–37 and complete Exercise D, which will also be followed by a group discussion.

Use the questions given in the exercise to structure the discussion. Participants should mention the points made in the answers to Exercise D in the back of the module. They may have other ideas as well. Be sure to mention any points from the answers that the participants do not raise.

Stress that it is very important to review the circumstances of deaths. Common factors in these deaths may suggest important problems that need to be solved, such as the extensive problems in the emergency room at this hospital.

At the end of the discussion, let participants check the answers on the answer sheet at the end of the exercise.

7. **Reading and short answer exercise**

This section is about calculating case fatality rates for a ward. Ask participants to read page 46 and complete the short answer exercise on page 47 about calculating case-fatality rates for a ward. Hold a brief discussion on how the case fatality rate is calculated: Do you include children in the number of deaths with SAM children who die in the emergency room, or in the first 24 hours after admission? How do you capture the number of children with SAM who die during transportation to the hospital?

**Nurses and nutritionists (as appropriate):** Using the flipchart, do the first problem in the short answer exercise as an example for the group. As the group works individually on the rest of the short answer exercise, look to see whether participants are having difficulty and help as needed.
Optional: You may wish to get the group’s attention and hold a very brief discussion. Ask participants if they know the case fatality rate for children with SAM at their hospitals. Ask how they could obtain the necessary information and calculate the rate. Could they do it on a regular basis?

8. Exercise E: Role-play – Problem-solving session

Ask participants to read pages 48–55 and then to see you about a role in the role-play in Exercise E.

In this role-play, participants will each take a role of someone who might be on the staff of a hospital. When participants come to you, assign them one of the roles below:

- Clinician in charge (this person will lead the problem-solving session)
- Senior nurse on duty in the morning (in some hospitals, this person is called the ‘Matron’)
- Senior nurse on duty in the afternoon
- Night nurse
- Home-craft worker
- Hospital administrator

**Nurses and nutritionists (as appropriate):** The role-play may go more smoothly if one facilitator plays the role of the ‘clinician in charge’ and the other facilitator records on the flipchart. Other roles should be assigned to participants.

Prior to this exercise, photocopy the role descriptions on the following pages and cut them out. Give each person a role description. In front of each person, place a card or folded piece of paper showing that person’s role. These cards will help participants remember who is playing what role.

Tell the ‘clinician in charge’ that he/she should take the lead in the discussion and should follow the process outlined on pages 5–10 of the module. Try not to interrupt. Assist only if the discussion becomes very much ‘off track’.

Ask someone to help by recording on the flipchart. The format below will help provide structure.

**Example of flipchart format**

<table>
<thead>
<tr>
<th>Problem:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Causes:</td>
</tr>
</tbody>
</table>
After the role-play, discuss what went well and what could have been improved. Ask whether participants could conduct such a session in their hospitals. Ask whether all of the solutions identified appear to be appropriate for the causes of the problem.

If there is time, you may do another role-play using a real problem observed in ward visits.

**Descriptions of roles**

**Clinician in charge**

From December through February, there were no deaths in the NRU. In the past week, there have been two deaths.

- Ekari, a 15-month-old girl, died during her second night in hospital (last Monday). She was dead when you arrived in the morning.
- Khama, a 24-month-old boy, died during his third night in hospital (last Wednesday). His NG tube had been removed and it was his first night to feed orally.

Both children were supposed to be taking F-75 every 2 hours.

There is no monitoring data for the nights of the deaths, and the 24-Hour Food Intake Charts were not completed during the night.

You suspect that the children were not fed during the night and that they became hypoglycaemic and died.

You want to know more about what happened so that this will not happen again.

**Senior nurse (morning), also known as the Matron**

You are on duty from 7:00 until 15:30. You remember the deaths of Ekari and Khama last week, although you were not present at night when they occurred.

When you arrived in the morning after Ekari had died, the night nurse and junior nurse (who had been on duty all night) were visibly upset. They had been trying to reach the clinician in charge for over 2 hours.

You are not sure what happened during the night, but you are very protective of the nursing staff, and you do not want to lose any more nurses. You feel that the ward is understaffed and overworked.

On the morning after Khama’s death, you found the junior nurse alone in the ward. The other night nurse had not reported for duty.
**Senior nurse (afternoon/evening)**

You are on duty from 15:00 until 22:30. You heard about the deaths of Ekari and Khama last week, although you were not present when they occurred.

When you left at 22:30 Monday night, Ekari was fine and was taking F-75 well at 2-hourly feeds.

On Wednesday evening, at about 18:00, you removed Khama’s NG tube so that he could take F-75 orally. He had two successful oral feeds before you left for the night. When you left, the junior nurse had arrived, but the other night nurse had not arrived.

---

**Night nurse**

You were recently moved from the infectious disease ward to the NRU. You have been on the night shift for only 2 weeks, and you are not yet used to the schedule. You get very tired at night.

You do not understand why children should be awakened every 2 hours to eat when they are sleeping soundly. When you wake the children, they often refuse to eat anyway.

You received no special training when you were moved to the NRU. You were simply told to feed the children according to their charts throughout the night.

On Monday night, when Ekari died, the junior auxiliary nurse woke you at 4:30 in a panic. You were not surprised when you couldn’t reach the clinician.

On Wednesday night, when Khama died, you did not come to work because your husband did not come home, and there was no one to stay with your own children. It was too late to find a substitute.

---

**Home-craft worker**

You work in the ward at night and were on duty when both Ekari and Khama died.

You try very hard to stay awake all night and feed the children, but sometimes you fall asleep.

You are very conscientious, and you were extremely upset when the children died. In Ekari’s case, you went to feed her at about 4:00 and she was dead. She was uncovered when you found her. Her mother had gone home for the night and was to return in the morning. You woke the other nurse and called the clinician, but he/she could not be reached.

In Khama’s case, you were alone because the other nurse did not show up. You realised that he was not taking his feeds well at 24:00 and 2:00, but you could not spend a lot of time with him because you had many other children to feed. Khama’s mother was very ill and was not with him in hospital. You do not know how to insert an NG tube.

At 4:00, you had trouble with waking Khama and tried to call the clinician, but he/she could not be reached. Khama never woke up.

---

**Hospital administrator**

The hospital recently lost some funding from the government, and you had to decrease staff. You decreased the number of night staff in particular, since the patients are sleeping then anyway.
You are not happy with the NRU because patients stay there so long. You wish they could be released after a week, or at most 2 weeks, and fed at home.

Recently, the senior nurses approached you about providing better accommodations for mothers at night, so that mothers would be more likely to stay with their children. You said there was simply no money for this. However, you realise during the problem-solving discussion that providing adult cots for mothers would be less expensive than hiring more night staff, and children with SAM are best sleeping with their mothers, which also will affect faster healing.

9. **Group discussion – Results of monitoring food preparation and ward procedures**

If there is time during the clinical session, participants will use the Supportive Supervision and the Quality Improvement Checklists, see Annex A and B in the module to monitor SAM management procedures and quality of care. The checklists are ‘tools’ for participants to adapt and use.

After the monitoring session, lead a group discussion. It would be inappropriate to discuss problems in front of the NRU staff, so the discussion should take place back in the classroom. If there was no time to use the checklists while in the NRU, participants may be able to complete them back in the classroom from memory of what they have observed during the visits. Or they may complete them from memories of their own hospitals.

Ask participants what problems they observed (‘No’ answers on the checklist). Select one or two important problems and discuss possible causes and possible solutions. You may use the problems in another role-play as in Exercise E. Ask participants to formulate recommendations for improvements and propose activities. They could indicate whether the proposed activities for improvement need additional resources or not. Activities for improvements that do not need extra resources could be initiated at any time soon.

10. **Group discussion – Reporting for SAM**

Ask participants to read section 6.0 on pages 57–61. When the participants finish reading, demonstrate how to use the monthly report by using the Treatment Cards of children in treatment and discharged during the given time period of reporting. The Monitoring Inpatient Management of SAM Job Aid in Annex C summarises the monitoring categories and is a useful tool for filling in the monthly report.

Exercise F will be done in groups. Share empty monthly reporting sheets. When the groups have finished doing Exercise F, lead a group discussion of the exercise.

When the participants finished filling the monthly reporting sheet, demonstrate how to use the monthly report to discuss performance. Explain how to calculate performance indicators for children who remain in inpatient care for rehabilitation until full recovery. Remind participants that these boxes can remain empty, or that absolute numbers can be used to interpret performance in case the hospital treats few cases or transfers most cases to outpatient care to end treatment. Performance indicators on outpatient care will also be calculated. When aggregating the information from inpatient care and outpatient care, the overall performance of the management of SAM in an administrative health unit may be calculated.

Discuss when indicators of performance are calculated and how they are calculated, and when absolute numbers only will be used, for interpreting performance of inpatient care. Briefly explain how, per the different levels of catchment area (i.e., facility [health centre], district and national levels), monthly reporting sheets from inpatient care and outpatient care sites are combined in a monthly facility or district report providing information on the overall management of SAM. The monthly facility (health
centre), district and national reports will be used to evaluate trends in SAM caseload and quality of care over time.

11. Summary of the module

1. Review the problem-solving process outlined in the introduction on page 1 of the module. Stress the importance of investigating causes before deciding on solutions.

2. Stress the importance of monitoring individual care and services, and the role of reporting in the management of SAM.

3. Review any points that you have noted below, and answer any questions that participants may still have. (If you cannot answer a question, offer to obtain more information and discuss it later.)
Facilitator Guidelines for Module 7: Involving Mothers in Care

<table>

<tr>
<td>8. Summarise the module.</td>
<td>------</td>
</tr>
</tbody>
</table>

* If it is more convenient, the group may do all of the reading in these steps and then view both videos.

Preparation for the module

Two video segments are shown in this module. Be sure that you have the videos and know when and where the video player with sound is available.

For the role-plays in Exercise B, it will be helpful to have some props: a baby doll with clothes, a basin for bathing, a towel and a cup and saucer for feeding. If these are not available, be creative about substitutions. For example, a rolled-up sweater can be a ‘baby’.

Photocopy and cut out role descriptions for the role-plays in Exercises B and D.

Blank sample Discharge Cards are provided with this Case Management Training. Before role-plays 1, 2 and 3 in Exercise D, complete a Transfer Form (1) or Discharge Card (2) with the following information. The ‘nurse’ will use this card in the role-play to give instructions to a mother. All of the information should be appropriate for the local area.

Role-play 1

- Name, date of birth, address for a 15-month-old boy
- Admission and discharge dates showing child has been in hospital 7 days
- Admission weight: 4.9 kg, MUAC 111 mm, oedema: mild (+)
- Amount of RUTF given to the child and how many to consume per day
- Transfer to outpatient care
- RUTF key messages provided to the mother and understood (observations should be made during the mother’s stay in hospital)
- Medications and supplements to be continued in outpatient care if this would still be the case.
- Enter a place and date for planned follow-up once a week in outpatient care
- Check to show that the child has received all immunisations

Role-play 2
- Name, date of birth, address for a 2-year-old boy
- Admission and discharge dates showing child has been in hospital 18 days
- Admission weight: 7.6 kg, MUAC 111 mm, length 78 cm
- What to feed: Local cereal staple, local vegetables and fruits, local sources of protein, local snacks
- How much/how often: Describe serving size in local terms; give family foods at meals three times each day, plus two nutritious snacks between meals
- Medications and supplements: Fill in blanks with appropriate information for local formulations
- Enter a place and date for planned follow-up 1 week from discharge date
- Check to show that the child has received all immunisations

Role-play 3
- Name, date of birth, address for a 4 month-old breastfed boy
- Admission and discharge dates showing infant has been in hospital 28 days
- Describe feeding support received and further needed
- Enter a place and date for planned community-based infant and young child feeding (IYCF) follow-up
- Check to show that the infant has received all immunisations

Decide whether your group will conduct the optional discussion in Exercise E. Your decision may be affected by the time available, the number of participants who work in hospitals where early discharge is common, typical hospital policies in the area and so on.

1. **Introduce Module 7**

   Explain that emotional, mental and physical stimulation are critical for children that have SAM. This module describes ways that hospitals can involve mothers to ensure that children receive such stimulation, both in hospital and later at home.

   It is hoped that participants have observed or will observe examples of how to involve mothers in the hospital ward. For example, they may have seen a teaching session or a play session that involved mothers. They will also see a video showing these types of sessions with mothers.
Point out the learning objectives on page 1 of the module.

2. Exercise A: Group discussion – Ways to involve mothers and other family members

Ask participants to read through page 2 of the module and prepare for the group discussion in Exercise A on page 3.

From personal experience and from ward visits, participants are sure to have many ideas of ways to involve family members, and things that can hinder involvement.

You may wish to structure the discussion by asking each participant in turn for one idea. Record the ideas on the flipchart.

Note: No answer sheets are given for the exercises in this module since they are all discussions or role-plays for which there are no ‘right’ answers.

3. Exercise B: Role-play – Teaching a mother to bathe or feed a child

Ask participants to read page 4 of the module and then come to you for instructions for the role-play. You will need to assign roles to four people for this exercise. For Role-play 1, assign someone to be a ‘bossy nurse’ and someone to be a mother. For Role-play 2, assign someone else to be a ‘nice nurse’ and someone else to be a mother. Others will observe and take notes.

Provide props as needed (for example, a baby doll, a basin for bathing, a towel, a cup and saucer) or creative substitutions for these.

Give role descriptions to those who will play roles. Role descriptions are below.

After each role-play, lead a brief discussion using the questions given in the module. Review the teaching process outlined on page 5 of the module. You may need to explain about the questions, which are asked to ensure that the learner understands. They should not be answered simply ‘yes’ or ‘no’. They should be more open-ended questions that ask, ‘How, what, how many and so on’.

For example, if a nurse has taught a recipe, she might then ask the mother such questions as: ‘What ingredients will you use?’ ‘How much oil will you put in?’ ‘How much will you feed your child?’

**Role descriptions for Exercise B**

**Role-play 1 – Bossy nurse**

You are a bossy and cold nurse. You are experienced, and you feel that you know better than all of the mothers. You tend to feel it is their fault that their children are malnourished.

You are supposed to teach a mother how to bathe her child. Instead of first showing her how, you start off by saying, ‘Let’s see how you do....’ Then you are critical of how she undresses the child, holds the child and so on. You end up taking over the procedure.
**Role-play 1 – Mother**

You are a young mother and this is your first child. You have no husband to help you, and you are very poor.

Your 15-month-old daughter has been on the ward for 2 days. She is better and is taking F-75 well by mouth now. She will be given a bath today. Although you are accustomed to bathing your daughter at home, you are nervous about doing it with the nurse watching you. You fear that the nurse will criticise you.

---

**Role-play 2 – Nice nurse**

You are a helpful and kind nurse. You feel it is important for mothers to learn how to feed and care for their children in the hospital.

You are going to teach a mother how to feed her child and encourage the child to eat.

You first explain what you are going to do, then you show the mother how to hold the child and so on, then you encourage her to try. You give helpful, positive suggestions. If the mother asks a question, you assure her that it is a good question, and you answer it carefully.

---

**Role-play 2 – Mother**

You are very timid and frightened about being in hospital. You are afraid your son, age 20 months, will die.

Your son was unable to eat on arrival at the hospital and was fed by NG tube for the first day. At the last two feeds, the nurse fed him successfully orally. At this feed, she will show you how to feed him.

---

**4. Video: Teaching Mothers about Home Feeding, Exercise C: Group discussion – Teaching mothers to feed children at home**

Explain that this video segment will show a teaching session in which khichuri (an example of a home food used in Bangladesh described in the module) is prepared. In the video, the mother is preparing a large amount of food for a hospital ward. Amounts used in the home would be smaller, as in the recipe in the module. Explain that some things have been done before the video begins. For example, the rice and lentils have been thoroughly washed, and the mother has washed her hands.

After the video, ask participants what they thought was done well in the teaching session and what could have been done better. How were examples given in the teaching session? How did mothers practise?

Participants may wish to view the video again. This is fine as long as other groups are not waiting.

Ask participants to begin thinking about how they will teach mothers about feeding in their own hospitals. Use the questions in Exercise C to structure a discussion.
5. **Reading and video: Malnutrition and *Mental Development***

Explain that this video shows how mental development can be encouraged through play in the hospital ward, at home and in the community. At three points in the video, there are opportunities for discussion. Questions for discussion will appear on the screen. These questions are printed below for your reference. Stop the video and take a moment to discuss these questions.

**First discussion point in video**

How can you:

- Make mothers feel welcome?
- Show your respect?
- Encourage play and interaction?
- Make the ward friendly?

What should mothers be allowed to do?

**Second discussion point in video**

Can you use any of these ideas (from the video)?

How will you:

- Use everyday activities?
- Involve mothers?

**Third discussion point in video**

Talk about:

- Toys
- How to start a programme of play and interaction

Stress that mental stimulation may be achieved during normal, everyday activities (such as washing and cooking) and by playing with simple, homemade toys. It does not require great amounts of time or expense.

6. **Exercise D: Role-play – Giving discharge instructions**

Ask participants to read pages 13–14 of the module, study the sample Transfer Form and Discharge Card and then come to you for instructions about the role-play in Exercise D (page 15).

Assign one person to be the nurse and one person to be the mother for each case. Give the nurse the Transfer or Discharge Card that you prepared earlier. For the first case give the nurse and the mother the role descriptions that follow, and orient them on the purpose of the role-play. For the second and third case, ask the nurse and mother to decide on their role description, following the case description in the module and the information on the discharge card, applying the learning from the course and the practice from you experience.
### Role Description Case 1

**Role-play: Nurse**

Follow the order of the Discharge Card carefully, covering all of the information on the card. Ask the mother questions to ensure that she understands. Specific information that this mother needs includes:

- **Give medications that should be continued at home, and ensure that the mother is clear on how much to give to the child.**
- **Ask the mother where the closest health facility with outpatient care to her home is located, and refer her to the health facility.**
- **Provide the RUTF key messages:**
  1. Do not share RUTF. RUTF is a food and medicine for very thin and swollen children only.
  2. Give small, regular meals of RUTF and encourage the child to eat often (five to six meals per day). Your child should have ___ packets per day. Thin and swollen children often do not like to eat.
  3. Continue to breastfeed regularly (if applicable). Offer breast milk first before every RUTF feed.
  4. Do not give other food. RUTF is the only food apart from breast milk that thin and swollen children need to recover during their time in outpatient care. Other foods, such as homemade foods (use local name or porridge), will be introduced when the child is recovering well and has eaten the full daily RUTF ration.
  5. Offer the child plenty of clean water to drink while he/she is eating RUTF. Children will need more water than normal.
  6. Wash the child’s hands and face with soap before feeding if possible.
  8. Keep the child covered and warm. Thin and swollen children get cold quickly.
  9. Do not stop feeding when a child has diarrhoea. Continue to feed RUTF and (if applicable) breast milk.
  10. Return to the health facility whenever the child’s condition deteriorates or if the child is not eating sufficiently.

- **This child is up-to-date on immunisations.**
- **The child needs a follow-up visit in 1 week at the health facility with Outpatient Care.**
- **Provide a 1-week ration of RUTF or until the mother can visit the health facility to which she is referred.**

Also give information on danger signs, how to play with the child and so on.

You are consistently courteous and helpful to the mother, correcting her nicely if she misunderstands.
**Case 2**

This mother and child have been in hospital for 18 days. The child, who is 2 years old, has reached the end-of-treatment criteria. The mother has already been taught carefully how to continue feeding at home with nutritious complementary food and how to play with her child. The mother and child are ready for discharge. It is now time for the nurse to review instructions with the mother using a discharge card. The nurse will use the sample discharge card given in Annex C of the module.

**Case 3**

This mother and infant have been in hospital for 28 days. The infant, who is 4 months old, is gaining weight well on exclusive breastfeeding and is ready for discharge. The mother has received good breastfeeding support but is still very insecure. It is now time for the nurse to review instructions with the mother using a discharge card. The nurse will use the sample discharge card given in Annex C of the module.

During the role-play, observers should refer to their Transfer Form and Discharge Cards in Annexes B and C of the module. and make notes so that they can answer the questions in the module. After the role-play, use these questions to structure a brief discussion.

Also ask whether this type of Transfer Form or Discharge Card would be useful in the participants’ own hospitals. How would they need to modify it?

7. **Optional Exercise E: Group discussion – Issues related to early discharge**

Ask participants to finish reading the module. If you plan to have the optional discussion in Exercise E, ask participants to prepare for the discussion.

Use the questions given in the module to structure the discussion.

8. **Summary of the module**

1. Emphasise the importance of involving mothers and family members in care at the hospital, as well as the importance of preparing them to continue good care at home.

2. Perhaps ask each participant to say one thing he/she will do in his/her hospital to encourage families to participate in care or to make the ward more stimulating for children. This can be a small thing, such as providing chairs for mothers or putting colourful pictures on the walls. Or it may be a large task, such as changing a hospital policy.

3. Review any points that you have noted below, and answer any questions that participants may still have. Tell participants that you have enjoyed working with them. If there are any further activities, such as a closing ceremony or a questionnaire to complete, give participants the relevant instructions.
Note: There will be an End-of-Course Evaluation and a Post-Course Test to organise.

The Course Director will share with you the questionnaires the participants will complete in the small groups.
Facilitator Guidelines for All Modules

1. Techniques for motivating participants

Encourage interaction

1. During the first day, you will talk individually with each participant several times (for example, during individual feedback). If you are friendly and helpful during these first interactions, it is likely that the participants will overcome their shyness, realise that you want to talk with them and interact with you more openly and productively throughout the Case Management Training.

2. Look carefully at each participant’s work (including answers to short answer exercises). Check to see if participants are having any problems, even if they do not ask for help. If you show interest and give each participant undivided attention, the participants will feel more compelled to do the work. Also, if the participants know that someone is interested in what they are doing, they are more likely to ask for help when they need it.

3. Be available to talk with participants as needed.

Keep participants involved in discussions

4. Frequently ask questions of participants to check their understanding and to keep them actively thinking and participating. Questions that begin with ‘what’, ‘why’ or ‘how’ require more than just a few words to answer. Avoid questions that can be answered with a simple ‘yes’ or ‘no’.

After asking a question, PAUSE. Give participants time to think and volunteer a response. A common mistake is to ask a question and then answer it yourself. If no one answers your question, rephrasing it can help break the tension of silence. But do not do this repeatedly. Some silence is productive.

5. Acknowledge all participants’ responses with a comment, a ‘thank you’ or a definite nod. This will make the participants feel valued and encourage participation. If you think a participant has missed the point, ask for clarification, or ask if another participant has a suggestion. If a participant feels his/her comment is ridiculed or ignored, he/she may withdraw from the discussion entirely or not speak voluntarily again.

6. Answer participants’ questions willingly, and encourage participants to ask questions when they have them rather than to hold the questions until a later time.

7. Do not feel compelled to answer every question yourself. Depending on the situation, you may turn the question back to the participant or invite other participants to respond. You may need to discuss the question with the Course Director or another facilitator before answering. Be prepared to say, ‘I don’t know but I’ll try to find out’.

8. Use names when you call on participants to speak, and when you give them credit or thanks. Use the speaker’s name when you refer back to a previous comment.

9. Maintain eye contact with the participants so everyone feels included. Be careful not to always look at the same participants. Looking at a participant for a few seconds will often prompt a reply, even from a shy participant.

Keep the session focused and lively

10. Keep your presentations lively:

- Present information conversationally rather than read it.
• Speak clearly. Vary the pitch and speed of your voice.
• Use examples from your own experience, and ask participants for examples from their experience.

11. Write key ideas on a flipchart as they are offered. (This is a good way to acknowledge responses. The speaker will know his/her suggestion has been heard and will appreciate having it recorded for the entire group to see.)

When recording ideas on a flipchart, use the participant’s own words if possible. If you must be briefer, paraphrase the idea and check it with the participant before writing it. You want to be sure that the participant feels that you understood and recorded his/her idea accurately.

Do not turn your back to the group for long periods as you write.

12. At the beginning of a discussion, write the main question on the flipchart. This will help participants stay on the subject. When needed, walk to the flipchart and point to the question.

Paraphrase and summarise frequently to keep participants focused. Ask participants for clarification of statements as needed. Also, encourage other participants to ask a speaker to repeat or clarify his/her statement.

Restate the original question to the group to get them focused on the main issue again. If you feel someone will resist getting back on track, first pause to get the group’s attention, tell them they have gone astray and then restate the original question.

Do not allow several participants to talk at once. When this occurs, stop the talkers and assign an order for speaking. (For example, say ‘Let’s hear Dr Banda’s comment first, then Mr Phiri’s, then Mrs Lungu’s.) People usually will not interrupt if they know they will have a turn to talk.

Thank participants whose comments are brief and to the point.

13. Try to encourage quieter participants to talk. Ask to hear from a participant in the group who has not spoken before, or walk toward someone to focus attention on him/her and make him/her feel that he/she is being asked to talk.

Manage any problems

14. Some participants may talk too much. Here are some suggestions on how to handle an overly talkative participant:

• Do not call on this person first after asking a question.

• After a participant has gone on for some time say, ‘You have had an opportunity to express your views. Let’s hear what some of the other participants have to say on this point’. Then rephrase the question and invite other participants to respond, or call on someone else immediately by saying, ‘Dr Banda, you had your hand up a few minutes ago’.

• When the participant pauses, break in quickly and ask to hear from another member of the group or ask a question of the group, such as, ‘What do the rest of you think about this point?’

• Record the participant’s main idea on the flipchart. As he/she continues to talk about the idea, point to it on the flipchart and say, ‘Thank you, we have noted your idea’. Then ask the group for another idea.

• Do not ask the talkative participant any more questions. If he/she answers all the questions directed to the group, ask for an answer from another individual specifically or from a specific subgroup. (For example, ask, ‘Does anyone on this side of the table have an idea?’)
15. Try to identify participants who have difficulty understanding or speaking the course language. Speak slowly and distinctly so that you can be more easily understood and encourage the participant in his/her efforts to communicate.

Discuss with the Course Director any language problems that might seriously impair the ability of a participant to understand the written material or the discussions. It may be possible to arrange help for the participant.

Discuss disruptive participants with your co-facilitator or with the Course Director. (The Course Director may be able to discuss matters privately with the disruptive individual.)

Reinforce participants’ efforts

16. As a facilitator, you will have your own style of interacting with participants. However, a few techniques for reinforcing participants’ efforts include:

- Avoiding use of facial expressions or comments that could cause participants to feel embarrassed
- Sitting or bending down to be on the same level as the participant when talking to him/her
- Answering questions thoughtfully, rather than hurriedly
- Encouraging participants to speak to you by allowing them time
- Appearing interested, saying ‘That’s a good question/suggestion’

17. Reinforce participants who:

- Try hard
- Ask for an explanation of a confusing point
- Do a good job on an exercise
- Participate in group discussions
- Help other participants (without distracting them by talking at length about irrelevant matters)

2. Techniques for relating modules to participants’ jobs

1. Discuss the use of these case management procedures in participants’ own hospitals. The guidelines for giving feedback on certain exercises suggest specific questions to ask. Be sure to ask these questions and listen to the participants’ answers. This will help participants begin to think about how to apply what they are learning.

Reinforce participants who discuss or ask questions about using these case management procedures by acknowledging and responding to their concerns.

3. Techniques for adapting materials for nurses (and nutritionists)

1. Use the suggestions for adapting materials for nurses and nutritionists (as appropriate) given in shaded boxes in the Facilitator Guide. These suggest additional demonstrations or explanations that may be needed. They also suggest parts of exercises that may be omitted, or that may be discussed as a group rather than done individually.

2. Be sensitive to the needs of your group. Give enough explanation that participants do not become frustrated. However, be aware that too much explanation can be boring and can be seen as condescending.
3. If your group becomes very frustrated, or is very far behind in the schedule, talk with the Course Director about adjustments that may be needed, such as omitting additional exercises or sections of reading.

4. **Techniques for assisting co-facilitators**

1. Spend some time with the co-facilitator when assignments are first made. Exchange information about prior teaching experiences and individual strengths, weaknesses and preferences. Agree on roles and responsibilities and how you can work together as a team.

2. Assist one another in providing individual feedback and conducting group discussions. For example, one facilitator may lead a group discussion, and the other may record the important ideas on the flipchart. The second facilitator could also check the *Facilitator Guide* and add any points that have been omitted.

3. Each day, review the teaching activities that will occur the next day (such as role-plays, demonstrations and drills), and agree who will prepare the demonstration, lead the drill, play each role, collect the supplies and so on.

4. Work together on each module rather than taking turns having sole responsibility for a module.

5. **When participants are working**

1. Look available, interested and ready to help.

2. Watch the participants as they work, and offer individual help if you see a participant looking troubled, staring into space, not writing answers or not turning pages. These are clues that the participant may need help.

3. Encourage participants to ask you questions whenever they would like some help.

4. If important issues or questions arise when you are talking with an individual, make note of them to discuss later with the entire group.

5. If a question arises that you feel you cannot answer adequately, obtain assistance as soon as possible from another facilitator or the Course Director.

6. Review the points in this *Facilitator Guide* so that you will be prepared to discuss the next exercise with the participants.

6. **When providing individual feedback**

1. Before giving individual feedback, refer to the appropriate notes in this guide to remind yourself of the major points to make.

2. Compare the participant’s answers to the answers provided in the back of each module as indicated.

3. If a participant’s answer to any exercise is incorrect or is unreasonable, ask the participant questions to determine why the error was made. There may be many reasons for an incorrect answer. For example, a participant may not understand the question, may not understand certain terms used in the exercise, may use different procedures at his/her hospital, may have overlooked some information about a case or may not understand a basic process being taught.

4. Once you have identified the reason(s) for the incorrect answer to the exercise, help the participant correct the problem. For example, you may only need to clarify the instructions. On the other hand, if the participant has difficulty understanding the process itself, you might try
using a specific case example to explain. After explaining, ask the participant questions to be sure he/she understands.

5. Give each participant the information to find the answers in the back of the module, if one is provided.

6. Always reinforce the participant for good work by (for example):
   − Commenting on his/her understanding
   − Showing enthusiasm for ideas for application of the skill in his/her work
   − Telling the participant that you enjoy discussing exercises with him
   − Letting the participant know that his/her hard work is appreciated

7. **When leading a group discussion**
   1. Plan to conduct the group discussion at a time when you are sure that all participants will have completed the preceding work. Wait to announce this time until most participants are ready, so that others will not hurry.
   2. Before beginning the discussion, refer to the appropriate notes in this guide to remind yourself of the purpose of the discussion and the major points to make.
   3. Always begin the group discussion by telling the participants the purpose of the discussion.
   4. Often there is no single correct answer that needs to be agreed on in a discussion. Just be sure that the conclusions of the group are reasonable and that all participants understand how the conclusions were reached.
   5. Try to get most of the group members involved in the discussion. Record key ideas on a flipchart as they are offered. Keep your participation to a minimum, but ask questions to keep the discussion active and on track.
   6. Always summarise, or ask a participant to summarise, what was discussed in the exercise. Tell participants they can find the answer sheet in the back of the module, if one is provided.
   7. Reinforce the participants for their good work by (for example):
      − Praising them for the list they compiled
      − Commenting on their understanding of the exercise
      − Commenting on their creative or useful suggestions for using the skills on the job
      − Praising them for their ability to work together as a group

8. **When coordinating a role-play**
   1. Before the role-play, refer to the appropriate notes in this guide to remind yourself of the purpose of the role-play, roles to be assigned, background information and major points to make in the group discussion afterwards.
   2. As participants come to you for instructions before the role-play:
      − Assign roles. At first, select individuals who are outgoing rather than shy, perhaps by asking for volunteers.
      − Give role-play participants any props needed, for example, a baby doll or a Discharge Card.
− Give role-play participants any background information needed. (There is usually some information for the ‘mother’ or ‘nurse’, which can be photocopied or clipped from this guide.)
− Suggest that role-play participants speak loudly.
− Allow preparation time for role-play participants.

3. When everyone is ready, arrange seating/placement of individuals involved. Have the players stand or sit apart from the rest of the group, where everyone can see them.

4. Begin by introducing the players in their roles and stating the purpose or situation. For example, you may need to describe the age of the child, assessment results and any treatment already given.

5. Interrupt if the players are having tremendous difficulty or have strayed from the purpose of the role-play.

6. When the role-play is finished, thank the players. Ensure that feedback offered by the rest of the group is supportive. First discuss things done well. Then discuss things that could be improved.

7. Try to get all group members involved in discussion after the role-play. In many cases, there are questions given in the module to help structure the discussion.

8. Ask participants to summarise what they learnt from the role-play.
